The Government, whose highest organ is the Cabinet of Ministers, determines trade policy in Japan. In the process of development and formulation of trade policy, consultations are held among the ministries concerned, between ministries and the political parties, business organizations at national and sectoral level, farmers' associations, etc. Study groups are often organized involving academics, journalists and other knowledgeable people. Most of these are conducted informally. Since the websites of the ministries are open, dialogues with NGOs are conducted on the specific issues of interest to them.

The political parties, particularly the ruling parties, have a final say on the passage of laws and approval of treaties. Under the parliamentary cabinet system, the Government and ruling party are usually in tandem so far as the general orientation of trade policy is concerned. If however, politicians representing different constituencies form special interest groups, they can wield strong influence on the subject of their interest, a typical example being a group of parliamentarians representing rural constituencies.

As for business circles, the Keidanren (Federation of Economic Organizations) and other economic groups from time to time present policy recommendations based on their own studies and on consultations with business people. The ministries concerned consult with different business sectors under their jurisdiction. The Association of Farmers is one of the most powerful groups, with its political connections and its alliance with many consumer groups.

I. Korea's Accession to the GATT

Korea joined the GATT in 1967 in the final phase of the Kennedy Round as the 71st Contracting Party. The decision to join the GATT was carefully weighed by the Korean government for several years after it launched the First Five-Year Economic Development Plan (1962–1966). However, once the decision had been made to accede to the GATT, the process was extremely fast. The application was made on May 20, 1966, and after five months of negotiations, from September 1966 to February 1967, the process of accession was completed in April 1967.

Interestingly enough, Korea's introduction to the GATT had come much earlier. Korea, as a newly independent nation after World War II, sent a delegation to Torquay, England in September 1950 to participate in the second trade round under the aegis of the GATT and to seek accession to the GATT. The records show that in Torquay, Korea made tariff offers on 31 items, including bituminous coal, chemical fertilizers, cotton, pesticides, whiskey and champagne. The Korean delegation also signed the Protocol of Accession,[1] which was endorsed by 25 of the 34 Contracting Parties of the GATT at the time. The accession did not materialize as the country, then in the midst of the Korean War, failed to take necessary steps, including the ratification of the Protocol of Accession.[2] As a poor country with hardly any international trade at the time, the decision to seek membership in the GATT in 1950 was primarily motivated by the desire of the Korean government, after gaining independence from Japan after World War II, to receive political recognition in the international community, particularly by seeking membership in any and all international organizations.

Unlike the time of the Torquay Round, Korea's decision to pursue GATT membership in 1966 was much more deliberate and commercially motivated. The new government, which came into power in 1962 through a military coup, had launched an ambitious outward-oriented Five-Year Economic Development Plan that year. Export promotion became one of the central policy thrusts of the Plan. Thanks to these policies, Korean exports began to take off, albeit from a small base. Korean exports grew annually by 45 percent during the first five-year plan, reaching US $250 million in 1966.

In July 1963, the Director General of the GATT sent a letter to the Korean government recommending GATT entry. This put in motion studies in the trade-related ministries about the benefits and costs of entry. On November 15, 1965, President Chung Hee Park instructed his government to officially review the desirability of GATT membership in one of the monthly Export Promotion Council Meetings at the Blue House, the Presidential Office. An inter-ministerial committee composed of the Ministries of Trade, Finance, and Foreign Affairs was created shortly thereafter for this purpose.

For a poor country pursuing an export-oriented development strategy, GATT membership was important in terms of securing most-favored-nation ("MFN") status from all 66 GATT Contracting Parties at the time. Korea had already concluded bilateral trade agreements with the United States (1956), Philippines (1961), Taiwan (1961) and Thailand (1961). As exports grew, more trade agreements were negotiated. However, this was a time-consuming and cumbersome procedure, while GATT membership provided a means of gaining MFN status in overseas markets without engaging in endless bilateral negotiations. GATT membership was also perceived by the Korean policy makers as providing opportunities for cooperating with other developing countries in combating

[1] BISD, Vol II, May 1952, at 33–34.

[2] For a brief description of the Korean participation in the Torquay Round, *see* Korean Customs Association, The History of Tariffs in Korea 354–355 (1969).

discrimination and protectionism against export items of interest to Korea, particularly agricultural and fishery products and cotton textiles.[3] The agricultural and fishery products were exported mainly to Japan and included silk yarn, fresh fish and dry seaweed, all of which were subject to some form of import quota in Japan.

It appears that the ministries concerned with trade policy, such as the Trade, Finance, and Foreign Ministries, had also carefully examined the "cost" of GATT membership in the wake of the government decision to apply. Their main interest was whether Korea as a developing country could, under the existing GATT framework, maintain flexibility in its existing economic and trade policies, which were marked by a high degree of government intervention in all sectors of economic policy. Such questions as whether Korea could pursue its trade liberalization at its own pace and whether industrial subsidies could continue to be provided appeared to have loomed large in the minds of policy makers examining the pros and cons of membership.[4] The addition of Chapter IV to the GATT in 1963, with its "special and differential treatment" for developing countries, was, therefore, an important development in this regard. It convinced the Korean policy makers that GATT membership, while providing substantial benefits to Korea, would not overly constrain Korea's economic and trade policies because of its developing country status. The Korean government thus decided to pursue GATT membership in early May 1966 and on May 20 it notified the GATT of Korea's intention to join the organization and to participate in the Kennedy Round.

The tariff negotiation part of the accession process took place in Geneva from September to December 1966. Korea's strategy was focused on limiting its own tariff concessions, rather than gaining tariff concessions from its trading partners in the GATT. Korea's offer to the seven Contracting Parties[5] that sought bilateral negotiations with Korea was limited in scope and many offers were confined to the binding of the existing tariff levels. These offers were therefore received with little enthusiasm by Korea's trading partners. However, as Korea was still a minor developing country with a small trade volume and a low per capita income, its major trading partners seem to have refrained from making many additional demands. When the negotiations were completed in December 1966, Korea made tariff concessions on sixty items, of which seventeen were tariff reductions, 41 were bindings at the existing tariff levels, and two were ceiling bindings. The combined imports of the seventeen duty reduction items in 1965 were less than $1 million, or about 0.2 percent of Korea's total imports of $463 million that year. The United States sought tariff reductions on several other items, including automobiles, but later relented. Japan withdrew its request for reductions on the condition that Korea would not seek any reciprocal concessions from Japan. New Zealand sought and received a tariff reduction on lamb meat from 35 to 25 percent.[6]

The GATT Working Party on Accession of Korea, composed of fourteen Contracting Parties, met twice, on November 30 and December 6, 1966, to examine the trade policy of Korea and to review Korea's plan to bring its trade regime into conformity with the GATT rules. The Korean delegation assured the Working Party members of its intention

[3] How the Korean government viewed the GATT accession is well explained by the Report to the Economic Ministers Meeting by the Minister of Foreign Affairs in the Proceedings of the Economic Ministers Meeting, No. 138, May 9, 1966.

[4] For the background of Korea's decision to apply for membership, *see* TAE-HYUK HAHM, REFLECTIONS ON THE GATT ACCESSION NEGOTIATIONS (1993).

[6] Hahm, *supra* note 4, at 23–25.

to further liberalize trade as Korea's balance of payments situation improved and as its infant industries gained in competitiveness.[7] The Working Party adopted the Protocol of Accession[8] on December 8 and sent its report to the General Council, which adopted the report of the Working Party by consensus a week later. The two-thirds majority required by Article XXXIII of the GATT for accession of new members was achieved by March 1, 1967.

The ratification process in Korea was extraordinarily swift. On March 6, 1967, the GATT Secretariat notified the Korean government that the requirements for accession under Article XXXIII had been fulfilled. On March 8, the joint meeting of the Committees of Finance and Economy, Trade, Industry and Energy, and Foreign Affairs of the Korean National Assembly unanimously approved the country's accession without much discussion. Two days later, on March 10, the Plenary Session of the National Assembly also approved the accession unanimously, again without much discussion. The National Assembly's ratification paved the way for the Korean Ambassador in Geneva to sign the Protocol of Accession on March 15 and Korea became a new Contracting Party one month later, on April 14, 1967. As a new Contracting Party in the GATT, Korea was soon to benefit from the 33 to 35 percent average global tariff cuts on some forty-one thousand items negotiated in the Kennedy Round, which was concluded on May 15, 1967. According to one Korean government estimate, Korea's benefits from tariff concessions of trading partners covered 44 percent of Korea's total exports in 1966.[9]

II. Korea in the GATT

A. Korea and the Multifiber Arrangement

Korea's role in the GATT in the early years of accession was quite marginal. This was natural, as Korea was still a small trading nation. It is perhaps ironic that Korea's first exposure to the GATT involved issues related to managed trade in textiles. Before it joined the GATT, Korea, as a minor cotton textiles exporter, became a signatory to the Long Term Arrangement for Trade in Cotton Textiles ("LTA") in 1964, and after joining the GATT, it took part in the extensions of this arrangement in 1967 and 1970. In the meantime, Korea concluded bilateral cotton textile restraint arrangements under the LTA with the United States, EEC, Canada, United Kingdom, Austria, Sweden, Australia, Denmark and Norway.

With the LTA due to expire on September 30, 1973, the GATT Contracting Parties began to discuss a possible new multilateral trade arrangement on all textile products in May 1972. Korea, as an emerging textile exporter, was opposed in principle to any multilateral arrangement aimed at regulating international trade in textiles. However, the threatened imposition of global quotas by importing countries convinced Korea to take part in the deliberations of the GATT Working Party, created for the purpose of negotiating a multilateral arrangement, which led to the Multifiber Arrangement. Textiles were Korea's single most important export item at the time, representing more than forty percent of total exports in 1972. This experience helped to convince the Korean authorities that the GATT was not an effective instrument against protectionism, which was regarded as one of the major obstacles to Korea's exports. Though international markets remained

open for most other Korean export products at the time, protectionism in the textile sector colored the negative Korean perception of the international trading system represented by GATT during the early years of Korea's membership.

B. The Tokyo Round

Although Korea had participated in the last phase of the Kennedy Round, its participation was quite limited and largely confined to the tariff concession negotiations in connection with Korea's accession to the GATT. In the Tokyo Round, which began in September 1973, Korea participated in the multilateral trade negotiations for the first time as a Contracting Party, but still as a minor player. It played a marginal role in the preparation of the Round, and, as a member of the Group of 77, its views were very typical of developing country positions on international trade at the time. The Korean delegate to the third and final session of the Preparatory Committee for Trade Negotiations on July 4, 1973 urged that the "participation of developing countries should be based on non-reciprocity, non-discrimination and preferential treatment principles", and that "priority should be given to the removal of non-tariff barriers to the products of export interest to developing countries."[10]

The Korean Minister attending the Tokyo Conference launching the new trade negotiations in September 1973 stated that "we are prepared to contribute in what way we can to trade negotiation," but he stressed that "the extent and manner of the contribution by developing countries could be considered only in the light of the additional and special benefits granted by the developed countries in the process of trade negotiations."[11] He went on to emphasize the importance of the Generalized System of Preferences, the need to offset the costs that would be incurred by developing countries as a result of the pending textile arrangements, and the need for differential treatment for developing countries in the new rules for the safeguard mechanism.

The major obstacles facing Korea's trade during the 1970s was protectionism on the part of developed countries. Starting with textiles in the early 1970s, it spread to other light industry products such as footwear, consumer electronics and steel products, and took the form of anti-dumping, countervailing, and safeguard measures, as well as voluntary restraint agreements. With Korea's exports surpassing the symbolic $10 billion mark in 1977, Korea's objective when the Tokyo Round negotiations entered the intensive phase was to roll back protectionism.

Korea made concessions in the tariff negotiations on some 657 items, or ten percent of all tariff lines, involving meat, chemicals, industrial machinery, and parts and components, among others, representing about thirty percent of Korea's total imports. The tariffs on these items were reduced by ten to twenty percentage points. Korea's tariff offer in the Tokyo Round was therefore quite considerable. Korea's request list included many major export items such as textiles, footwear, leather products, steel, and consumer electronic products, but tariff concessions by trading partners on labor-intensive products such as textiles, footwear, and leather products were rather limited.

In the non-tariff barrier negotiations, Korea, as a member of the Group of 77, actively participated in the safeguard negotiations with the objective of removing "selectivity"

(i.e., non-MFN application of safeguards) and of dismantling gray-area measures, but without much success. Korea also had important stakes in the negotiation of customs valuations, anti-dumping, and subsidies and countervailing duties, and sided with other countries which had similar positions on these issues. Korea joined several MTN Agreements such as Subsidies and Countervailing Duties (June 1980), Technical Barriers to Trade (September 1980), Customs Valuation (January 1981) and Anti-dumping (February 1986), but never joined the Import Licensing Agreement. It was not until April 1994, in the final phase of the Uruguay Round, that Korea's accession to the Agreement on Government Procurement was finalized, with implementation taking place three years later, in 1997. From the point of view of rolling back protectionism, the Custom Valuation Agreement was probably the most significant result for Korea as it removed the American Selling Price ("ASP") system in the United States. Customs valuation under the ASP system was based on the U.S. wholesale price instead of the FOB price of the imported products, and as such, acted as a substantial tariff barrier to major Korean export items to the United States at the time, such as footwear, canned products, and hand-knit gloves.

C. Balance-of-Payment Consultations

Although unilateral import liberalization policies had been adopted in Korea since the beginning of the 1980s, a substantial number of products, particularly agricultural products, remained on the restricted list subject to import quotas until the late 1980s. Korea's import restrictions had been justified by the balance-of-payments provisions under Article XVIII:B of the GATT since it had acceded to the GATT in 1967. It had numerous consultations with the Committee on Balance-of-Payment Restrictions ("BOP Committee") between 1969 and 1986. In none of these consultations was Korea's right as a developing country to invoke Article XVIII:B restrictions questioned as Korea had been registering substantial trade deficits every year since it joined the GATT.

This situation changed dramatically in the 1987 consultation with the BOP Committee because Korea's current account had registered a surplus for the first time in 1986. The external current account registered surpluses of $5 billion (five percent of GNP) in 1986 and $10 billion (eight percent of GNP) in 1987. Moreover, real GNP grew by twelve percent annually for both years following a year of relative slow growth in 1985.

Korea had undertaken to liberalize its import system unilaterally since 1980, when over thirty percent of all tariff lines were listed as restricted imports. By 1983, this proportion had been reduced to nineteen percent and, starting in 1983, a major new three-year trade liberalization program was launched with the objective of reducing the share of the restricted items to five percent of all tariff lines by 1988. In 1984, a five-year tariff reduction program was also launched with the object of lowering the average tariff from 23.7 percent in 1983 to 18.1 percent in 1988.

When Korea consulted with the BOP Committee in November 1987, the prevailing view of the Committee was that Korea's current economic situation and outlook for the balance-of-payments "was such that import restrictions could no longer be justified under Article XVIII:B." The Committee also stressed the need to establish a clear timetable for the early and progressive removal of Korea's restrictive trade measures maintained for balance-of-payments purposes. The Committee welcomed Korea's willingness to consult with the Committee in the first part of 1989, but "the expectation was expressed that Korea would be able in the meantime to establish a timetable for the

phasing out of balance-of-payments restrictions, and that Korea would consider alternative GATT justifications for any remaining measures, thus obviating the need for such consultations."[12]

In the light of these strong views by its trading partners, the new Korean government, which came into power in February 1988, began to consider seriously how to dismantle BOP restrictions. It expedited import liberalization and tariff reduction programs. In April 1989, the government announced a new three-year program (1989–1991) of liberalization covering 273 products including 237 agricultural items. In the same year, another five-year tariff reduction program (1989–1993) called for the lowering of the average tariff rate from 18.1 percent in 1988 to 7.9 percent in 1993, which, according to the Korean government, was "comparable to levels in OECD countries."[13]

In the meantime, the Korean economy continued to perform well in 1988. Real GDP grew by over twelve percent for the third consecutive year and the current account surplus increased from eight percent of GNP, or $10 billion, in 1987 to 8.5 percent of GNP, or $14.5 billion, in 1988. While labor unrest was widespread and there were substantial inflationary pressures and slower output and export growth, gross official reserves continued to rise, reaching $14 billion by March 1989, equivalent to three months' worth of 1988 imports. Korea's foreign debt also declined.

Under these circumstances, the Korean government decided to disinvoke the BOP restrictions under certain conditions. When the BOP Committee reconvened in June 1989, the IMF Representative stated his preliminary view that in light of Korea's balance-of-payments and reserve position, restrictions on imports could no longer be justified on balance-of-payments grounds. He confirmed this view in October 1989 after the IMF's Article IV consultations with Korea, which were held shortly before the BOP consultation in the GATT. In his opening statement, the Korean representative stated that while Korea believed that "a continued invocation of Article XVIII:B for some time would be most desirable," he did not "foreclose the possibility of discussing disinvocation . . . provided that the BOP Committee recognizes Korea's need for and agrees to a grace period sufficiently long enough for further liberalization and phase-out of the restrictions presently under BOP cover after its disinvocation, and reaches an understanding that Korea will not be subject to any unilateral actions or to multilateral legal challenges in terms of GATT provisions during the agreed grace period."[14]

The negotiations to determine the conditions of disinvocation were difficult and were carried over to another round of consultations in October 1989. For Korea, having a long grace period was important because the bulk of the remaining restrictions were agricultural products. In the October consultation, the Korean representative strongly objected that:

> "[i]f. . . Korea, a developing country experiencing balance-of-payment surplus only for three years in its entire history, were to be completely undressed of all protection of its agriculture and thrown out in the cold with only a nominal grace period, we cannot but express our serious doubt as to the justice and fairness of the GATT system itself."[15]

[12] *Consultation with Korea*, Committee on Balance-of-Payment Restrictions, GATT, BOP/R/171, December 10, 1987.

[13] *Statement by Korea*, June 27, 1987 in Ministry of Foreign Affairs, THE GATT BOP CONSULTATIONS 69 (1989).

[14] *Id*. at 70–71.

[15] *Id*. at 74 (Statement by Korea, October 23, 1989).

The BOP Committee finally agreed on the terms of disinvocation in late October. Korea agreed to disinvoke Article XVIII:B as of January 1, 1990 under the understanding that Korea would phase out its remaining restrictions or bring them into conformity with other GATT provisions by July 1, 1997. The eight-year grace period was in recognition of the flexibility necessary for Korea, particularly in the agricultural sector. It was also decided that Korea could phase out its remaining restrictions in two three-year tranches after the current liberalization program expired in 1991. Korea was also to notify the GATT Council of the three-year programs by March of the year before their introduction. It was also understood that the other Contracting Parties would exercise due restraint in the application of their rights under the General Agreement in relation to products included in the liberalization programs.[16]

Korea's disinvocation of Article XVIII:B in October 1989 was the first case of a developing country losing its BOP cover in the GATT. As a result of this decision, Korea was forced to begin market liberalization in agriculture, which had been the most protected sector in the Korean economy. However, Korea was given an eight-year transition period and the decision of the BOP Committee was superceded by the Agreement on Agriculture in the Uruguay Round four years later.

D. The Beef Panel

Korea's right to maintain import restrictions under the balance-of-payments provisions under Article XVIII:B of the GATT was challenged under the GATT dispute settlement mechanism when Korea prohibited all imports of beef into the country in 1985 because of the sharp decline in domestic beef prices. In October 1984, Korea stopped issuing tenders for commercial imports to the general market, and in May 1985 orders for imports of high quality beef for the hotel market also ceased. No commercial imports of beef took place between May 1985 and August 1988, when Korea partially reopened its market under a quota system. The prohibition of beef imports was challenged by the United States. Korea initially blocked the establishment of a panel after bilateral consultations had failed to produce satisfactory results, but ultimately withdrew its objection.[17]

The Panel found, among other things, that a) import measures introduced in 1984/85 and amended in 1988 were inconsistent with GATT Article XVIII:B;[18] and b) in the light of the continued improvement of the Korean balance-of-payments situation, there was a need for the prompt establishment of a timetable for the phasing out of Korea's balance-of-payment restrictions on beef, as called for by the Contracting Parties in adopting the 1987 Balance-of-Payments Committee report.[19]

Although Korea initially did not agree to the adoption of the panel reports, in the Council meeting held on November 6, 1989, after the BOP Committee had concluded its consultations with Korea and Korea had disinvoked Article XVIII:B, Korea announced that it would not block adoption of the panel reports.[20]

III. Korea in the Uruguay Round

A. Background

Korea was an active participant in the Uruguay Round. It played a significant role both in launching the round and in the negotiations themselves. The enhanced role of Korea was the result of a number of developments that had taken place in Korea as well as in the international economy in the several years preceding the launching of the round in 1986.

At home, Korea had shifted, at the beginning of the 1980s, from heavily interventionist policies to more market-based policies. It also embarked on an ambitious trade liberalization program. In the previous decade, Korea had experimented with import substitution policies under the Heavy and Chemical Industry ("HCI") policy. Under this policy drive, officially announced in 1973, credit, interest rate, tax, and trade policies were used to promote development of "key" industries, such as iron and steel, non-ferrous metals, shipbuilding, machinery, automobiles, electronics and petrochemicals.[21] While this policy laid the foundation for industrial growth in Korea in the 1980s and beyond, it contributed to serious structural imbalances and inflationary pressures in the Korean economy by the late 1970s. In 1979, the policy was officially abandoned, and the government began to take measures to correct resource misallocation emerging from the HCI policy and to enhance the competitiveness of Korean industries. The Korean government began making trade liberalizing measures in late 1978 and, as described earlier, these trade liberalizing initiatives were strengthened when the government subsequently launched a pre-announced three-year program to expand the scope of automatic import licensing in 1983 and a five-year program to reduce tariffs in 1984. These plans were renewed in subsequent years and continued until the early 1990s. In 1985, industry-specific promotion laws enacted during the late 1960s and the early 1970s were replaced by the Industrial Development Act which was intended to promote restructuring and technological development on an industry-wide basis.

Under the new market-based macroeconomic policies and ambitious trade liberalization programs, the Korean economy regained its competitiveness and performed well in 1985. Under these circumstances and with regained confidence, Korea began to look favorably upon the global effort to launch a new trade round. Another reason why Korea looked favorably toward the new multilateral trade negotiations was the perception in trade policy circles that it might be an answer to a number of challenges facing Korea in the worsening global trade environment. The first of these challenges was the growing protectionism abroad. As Korea's presence in the world markets became more prominent, protectionist measures were imposed with increasing frequency on Korean export products.

According to a study made by the Ministry of Trade and Industry, from 1982 to 1985 some 270[22] of Korea's export items were subject to import restrictions in 21 industrial countries, covering about thirty percent of total exports to these countries. These restrictions took the form of safeguard measures, voluntary export restraints, and the imposition of anti-dumping and countervailing duties. In 1984, Korea concluded a voluntary export restraint arrangement on steel products, another major export item, with the United States. By the end of 1985, many anti-dumping and countervailing duties had been imposed on Korean export products, ranging from photo albums to color television receivers. In

[21] For the HCI policy drive, *see Trade Policy Review of Korea*, GATT, C/RM/S/27A, June 2, 1992, at 9–10.
[22] Based on CCCN 4-digit classification. *See* MINISTRY OF TRADE AND INDUSTRY, FORTY YEARS OF TRADE PROMOTION 573 (1998).

1985 alone, fifteen new anti-dumping and countervailing duty investigations on Korean export products were initiated by Korea's trading partners, ten of them by the United States.

The other challenge was growing market opening pressure from Korea's trading partners. By the mid-1980s, Korea was beginning to face strong market opening pressures from its trading partners, particularly from the United States. Bilateral trade between the two countries expanded rapidly during the 1960s, 1970s and 1980s. The United States was Korea's number one trading partner with a bilateral trade volume of $17 billion in 1985. Korean exporters' dependence on the U.S. market was considerable, with 35.5 percent of Korea's total exports going to that market in the same year. Korea's trade balance with the United States registered a surplus for the first time in 1982, and it expanded to $4.3 billion in 1985.

The United States began demanding market-opening measures in 1983, initially in the form of demanding tariff reductions and removing quantitative restrictions in the goods sector. Later, a full trade offensive involving service sectors and the protection of intellectual property was undertaken, utilizing Section 301 of the U.S. Trade Act of 1974, which authorizes the U.S. government to take trade actions against unfair practices of foreign countries.[23] In September and October of 1985, for example, investigations and subsequent negotiations took place on Korea's insurance market and the protection of intellectual property rights. As a result of these negotiations, Korea promised to partly open its fire and life insurance markets to U.S. firms and to modernize its copyright, software and patent laws. In addition, several patent infringement cases involving Korean products were filed with the U.S. International Trade Commission in the mid-1980s. By the mid-1980s, therefore, the "Regular", "Special",[24] and "Super"[25] 301 negotiations and other trade frictions with the United States dominated Korea's trade policy agenda. In trade policy circles, the new trade round was increasingly seen as a way to counter these unilateral trade offensives by Korea's most important trading partner.

As Korea faced more protectionism abroad and pressure from its trading partners to open its domestic market, it became evident to its policy makers that Korea's overall economic interests were quite consistent with the objectives of the new trade round. Korea therefore became one of the most active supporters of the launching of a new trade round. Korea thus took a very positive stance toward the launching of a new round in Punta del Este, Uruguay in September 1986. The head of the Korean delegation, strongly urging a consensus on launching the new round, advocated that both "old" and "new" issues should be discussed. He stated that Korea attached importance to "tighter safeguard principles, the elimination of non-tariff measures and the strengthening of dispute settlement procedures." As for the new issues, he believed that "the trading nations should recognize that the world economy is constantly evolving and that the trading system needs to be more responsive to this change, "but that the interests and concerns of developing countries should be fully reflected in adapting our trading system to meet new challenges."[26] He supported two other initiatives to strengthen the functioning of the GATT. One was to establish a permanent surveillance body in the GATT to monitor the trade policies

[23] *See* 19 U.S.C. §2411–2419.

[24] The so-called "Special" Section 301 is aimed at actions of foreign governments that deny adequate and effective protection to U.S. owners of intellectual property rights. *See* 19 U.S.C. §2442.

[25] "Super" 301 could be invoked against particularly egregious unfair practices. *See* 19 U.S.C. §2420.

[26] *Korea:* Statement by H. E. Woong-Bae Rha, Minister of Trade and Industry at the Meeting of the GATT Contracting Parties at Ministerial Level, September 15–19, 1986, Punta del Este, Uruguay, GATT, MIN(86)/ST/11, September 16, 1986.

and practices of GATT Contracting Parties. The other was for ministers to become more involved in the decision-making process of the GATT by meeting periodically on a regular basis.[27] Both of these initiatives were later to be realized in the Uruguay Round through the institutionalization of the trade policy review mechanism and the Ministerial Conference as the highest decision-making body of the WTO.

B. Korea's Participation in the Uruguay Round

1. Korea's Objectives in the Round

Korea's objectives in the Uruguay Round were much more clearly defined than in the Tokyo round. The multilateral trading system was seen as providing the best means of resisting bilateral trade pressures and as an important constraint on protectionist pressures as well as on the negative aspects of the trend towards regionalism. Korea was therefore interested in improving the GATT's ineffective dispute settlement procedure, opposing selective safeguards, stopping abuses of anti-dumping measures, and integrating textiles into the GATT. On the other hand, Korea's goals in the round with respect to agriculture were defensive. While supporting progressive liberalization in agriculture, Korea argued strongly that certain agricultural products, including rice, should be shielded from foreign competition.

As far as the new areas were concerned, Korea had neither a strong service sector nor a strong system of protection of intellectual property rights. Therefore, Korea was not in the forefront of those countries which argued strongly for liberalization of trade in services and protection of intellectual property rights. However, Korea supported the inclusion of these sectors in the new round in the name of strengthening and bringing up to date the rules of the multilateral trading system. As for intellectual property rights, Korea had already embarked on the modernization of its laws, partly in response to the bilateral trade pressures of industrialized countries, particularly the United States in the early 1980s. As a result, the new negotiations were not expected to impose overly difficult new obligations to Korea. It was also widely believed that strengthening of intellectual property rights would be an important factor to technological advancement in Korea, and that Korea therefore needed to protect intellectual property rights vigorously.

The service sector in Korea had come to occupy more than fifty percent of Korea's GDP at the beginning of the 1980s and 55.9 percent by 1985. According to GATT statistics, Korea's service exports reached $8 billion and imports $5 billion respectively in 1987, making Korea the fifteenth largest exporter and nineteenth largest importer of services in the world by 1987.[28] Despite the size of the service industry in Korea, however, the industry as a whole lagged behind the manufacturing sector due to the small domestic market, heavy regulation, and low level of productivity and research and development in many service sectors. Therefore the inclusion of services in the negotiation was generally seen as a burden to the Korean economy. On the other hand, Korea was seen to have a comparative advantage in construction services and in the movement of natural persons.

2. Korea in the Negotiations

Korea played a much more important role in the Uruguay Round than in the Tokyo Round. The more important role for Korea in the negotiations was a reflection of Korea's

[27] *Id.*

[28] *See* Taeho Park, *Services Negotiations in the Uruguay Round and Korea's Countermeasures*, in KOREA INTERNATIONAL ECONOMIC POLICY INSTITUTE, SEMINAR ON URUGUAY ROUND AND KOREA'S RESPONSE (1996).

enhanced status as a trading nation. By 1986 Korea had become the thirteenth largest trading nation in the world, with a two-way trade volume of $66 billion. Its industries, such as textiles, electronics, shipbuilding, steel, and automobiles, were already global in scale and in competitiveness. Korea thus had an important stake in the outcome of negotiations, and the Korean government placed a high priority on the round by increasing resources for the negotiations, as well as putting into place a national framework of preparations for the Uruguay Round.

In December 1986, the government created an interagency committee on the Uruguay Round under the Economic Planning Board, which had a coordinating role in domestic and international economic policy matters. The Uruguay Round Committee, as it was called, was composed of high level officials from nearly all economic ministries and the Foreign Ministry. The Committee reported on important matters to the ministerial level International Cooperation Committee headed by the Deputy Prime Minister, who was concurrently the Minister of Economic Planning. The Uruguay Round Committee was also divided into seven subcommittees composed of officials of relevant ministries and experts in the private sector. The positions developed by the subcommittees were screened and coordinated by the Uruguay Round Committee before they were officially communicated to the various negotiating groups created under the Trade Negotiating Committee in Geneva.

Although Korea's experience in multilateral trade negotiations was rather limited, it played a fairly active role in every phase of the Uruguay Round. As a member of the "De la Paix" group, it participated in many useful initiatives that helped to advance negotiations in many areas. Unlike in the previous round, the Korean delegation made many written proposals independently of other countries in nearly every negotiating area of the round. The Deputy Minister of Trade in the Ministry of Trade and Industry was chosen as the Chairperson of NG 8, the Negotiating Group on MTN Agreements.[29] Korea made some twenty-five written proposals during the Uruguay Round, covering issues such as dispute settlement, safeguards, anti-dumping, subsidies, agriculture, services and intellectual property. The most extensive Korean proposal was probably in the area of anti-dumping, where Korea initially proposed renegotiation of at least thirteen aspects of the Anti-dumping Code agreed during the Tokyo Round.[30]

3. The Results of the Uruguay Round for Korea

The Korean reaction to the results of the Uruguay Round was generally favorable except with respect to agriculture. The market access results were seen as creating new export opportunities for Korea in the world market. The 35 percent tariff reductions by industrial countries and the substantial lowering of tariffs and the tariff bindings on the part of developing countries provided significant market access opportunities for Korea. Korea's own market access commitments were considerable. Tariffs were to be reduced from the base level of 18 percent to 8.3 percent by 2004, a reduction of 54 percent. Tariff bindings increased from 24 percent to 90 percent of all tariff lines on industrial products. Korea also participated in zero for zero negotiations initiated by the Quad countries. Out of 75 items, Korea agreed to an immediate zero tariff on fifty items, and an eight to ten-year

[29] Chulsu Kim, the author of this chapter and later the Deputy Director-General of the WTO, was chosen as Chairperson in his personal capacity.

[30] GATT, MTN. GNG/NG8/W/3, May 20, 1987. For the role of Korea in the anti-dumping negotiation in the Uruguay Round, *see* JOHN CROOME, RESHAPING THE WORLD TRADING SYSTEM: A HISTORY OF THE URUGUAY ROUND 77–84, 209 (1995).

phase-out period for seventeen items. Korea also participated in tariff harmonization on chemical products, making concessions on 193 of 196 items. These substantial tariff commitments, however, did not require a major overhaul in Korea's tariff structure, as many concessions were well within the existing tariff rates resulting from the unilateral reductions that had taken place since the 1980s.[31]

The strengthening of the rules and the dispute settlement mechanism in the round were widely received in Korea as welcome developments as they were expected to reduce unilateral trade pressures on the part of major trading partners. The phase-out of gray area measures and strengthened rules in anti-dumping and countervailing duties, negotiated in the Uruguay Round, were also expected to act as a strong deterrent to protectionism facing Korean exports. With respect to textiles, the reaction to the ten-year phase-out of the MFA under the Agreement on Textiles and Clothing was mixed. It was generally seen as a disadvantage rather than an advantage by the Korean textile industry since the industry's significant global market share accumulated with large quotas was expected to be reduced in the liberalization process as a result of competition from lower-cost suppliers.

In a few cases, the new Uruguay Round agreements imposed new obligations on Korea's trade policy. The Agreement on Subsidies and Countervailing Duties required Korea to phase out some existing export and domestic subsidies. Under the Agreement on Import Licensing, which became a multilateral agreement as a result of the Uruguay Round, Korea was required to phase out an Import Diversification Program that was targeted against Japan. Under this program, which was introduced in 1978, some designated products of Japanese origin were not allowed to be imported into Korea for domestic consumption even when the same product was liberalized and therefore could be imported from all other sources.

Korea's commitments in the new areas were expected to be substantial. In reality, however, they turned out to be only moderate. In services, Korea has assumed commitments in about half of the negotiated service sectors, i.e., 78 out of 155 total service sectors. Korea made full commitments in construction and engineering services, but its commitments in other services, such as financial, telecommunications, and transportation services, were only partial. Korea did not make any commitments in educational, health, and social services nor in recreational, cultural, and sporting services, among others. Korea's commitment also included only one MFN exemption, in computer reservation services, thereby offering non-discriminatory treatment in virtually all service sectors where concessions had been made.

In intellectual property rights, the TRIPS Agreement introduced a high standard of protection. However, Korea had already introduced strong protection in all areas of intellectual property laws, partly due to the bilateral agreements negotiated with major trading partners during the mid-1980s. Korea's new obligations in this area were few, such as the extension of patent and computer software protection periods and the introduction of color trademarks.

Korea's participation with respect to agriculture was defensive and very controversial at home. Korea's negotiations with its trading partners had also been complicated by the recommendation of the BOP Committee in 1989, when Korea agreed to phase out

[31] For a general discussion of Korea's commitment in the Uruguay Round, *see* Choi, Nakgyoon, *Trade Opportunities in the Post-UR Regime* : *Korea's Perspective*, OCCASIONAL PAPERS, No. 19 (Korean Institute for Industrial Economics and Trade). *See also* MINISTRY OF FOREIGN AFFAIRS, THE RESULTS AND ASSESSMENT OF THE URUGUAY ROUND 31–39 (1994).

all quantitative restrictions by July 1, 1997. Korea resisted tariffication of agricultural import quotas without exception until the very last phase of the negotiation. In the end, Korea, like Japan, received special treatment on rice, but as a developing country received more favorable treatment than Japan. Korea was permitted to delay tariffication on rice until 2004, but was required to guarantee minimum market access in the meantime. Quantitative restrictions on other agricultural products, such as beef, chicken, and pork, were to be phased out over shorter periods of time, while tariffs were to be raised.

While Korea had made a very difficult decision in the Uruguay Round with respect to agricultural liberalization, which would require wide-ranging structural adjustments in that sector, the overall assessment of the round by the Korean government was quite positive. The Korean Trade Minister attending the Marrakesh Meeting stated that the "Uruguay Round Agreement has substantially strengthened the principle of multilateralism," and that "it has, *inter alia*, reduced barriers in various sectors, made the rules more transparent and introduced a stronger dispute settlement system." He went on to say that "I am confident that this agreement will go a long way toward helping maintain Korea's development momentum."[32]

4. Implementation

Immediately after the conclusion of the Uruguay Round negotiations in December 1993, the Korean Government began to revise the relevant laws in accordance with the new WTO agreements. As a result, Korea had almost completed the legislative work related to its Uruguay Round obligation by December 1994, before the launching of the WTO. Even in areas where the implementation period had not expired, Korea had revised related laws in advance. By the end of December 1995, Korea had revised a total of 24 laws related to Uruguay Round agreements.[33] No serious slippages relating to Korea's implementation efforts have been pointed out by other Members in the subsequent meetings of the WTO committees, nor has its implementation record been challenged in the dispute settlement process.

IV. The Impact of the GATT/WTO and the Uruguay Round on Korea

The impact of the GATT and the WTO on Korea has been quite considerable since it joined the GATT in 1967. However, this impact was not widely perceived by the general public until the time of the Uruguay Round. The GATT was important only to a handful of trade policy makers in the Economic and Foreign Ministries of the government until the late 1980s. As a country which has relied on trade for economic development, trade was an important matter for many of its citizens, but the GATT seemed to have left few imprints in the minds of the Korean public in the development years. This is probably due to the fact that the GATT was not perceived as a strong international institution effectively addressing the concerns of Korea in the international trading arena. Also, as a poor developing country, Korea's trade policies were little affected by GATT obligations in the early years of association with the organization. For many years, bilateral trade issues were regarded as much more important than multilateral trade issues.

While there is no question that multilateral initiatives in the GATT were important in terms of increasing market access for Korean industrial products in the 1970s and the

[32] Statement by Mr. Chulsu Kim, Minister of Trade, Industry, and Energy, April 12, 1994, GATT, Marrakesh MTN. TNC/MIN(94)/ST/19.

[33] *Trade Policy Review of Korea*, Report by the Government, WT/TPR/G/19, (1996), at 7.

1980s, Korean participation and influence in these initiatives were not significant. Korea reaped benefits from the negotiations, but as a typical developing country it did not have to make similar contributions in return. Moreover, Korean exports boomed after it joined the GATT. In most areas, the security and the predictability of market access provided by the GATT system were essential to Korea's success as a trading nation. However, these benefits were taken for granted. The GATT was also seen by the public as ineffective in addressing the market access concerns of Korea in the 1970s. Soon after it joined the GATT, Korea was forced to accept the MFA regime on one of its then most important export products. Protectionism spread to other areas in the form of safeguard actions, gray-area measures such as voluntary export restraint programs, and anti-dumping and countervailing duties.

Having failed to grapple effectively with these issues, the GATT was not seen in Korea as an effective organization, able to curb the protectionist policies of some of its members. Bilateral trade issues therefore dominated Korea's international trade policy agenda during the 1970s. Korea tried to deal with the protectionist policies of its major trading partners without recourse to the GATT, and negotiated bilateral trade deals with them to ensure continued market access for the affected products.

The bilateral thrust in Korea's trade policy continued through much of the 1980s but with a different emphasis. The emergence of Korea as an advanced developing country and as a major trading nation shifted its trade issues to a different plane. Korea's trading partners, particularly the United States, began to demand greater market access for their products and services and considerable national tensions were created in the process of resolving these bilateral trade frictions. As a result, a greater public awareness and interest developed over trade issues.[34]

The launching of the Uruguay Round in Punta del Este in September 1986 did not attract much public attention in Korea. As the Round proceeded, public interest grew. The balance-of-payments consultations in 1987 and 1989 and the *Beef* panel in the same year demonstrated vividly how the GATT could force Korea to make the difficult decision to open up its agricultural market. As the final phase of the Uruguay Round approached, it was clear to the Korean public that the Uruguay Round would have a significant impact in defining Korea's trade position in the world. The GATT was then in the forefront of public attention in Korea.

The impact of the GATT, the WTO, and the Uruguay Round on Korea have been substantial. Their economic effect should perhaps be considered as the most significant. However, political and social implications have also been considerable, particularly those of the Uruguay Round. An increasing number of Korean NGOs have begun to express views on WTO-related matters since the WTO Ministerial Conference in Seattle in 1999.

A. Economic Impact

Korea has benefited immensely from the GATT/WTO system. The system's open, liberal, and rules-based policies have provided a favorable external environment for the outward development strategy adopted by Korea since the early 1960s. The main features of the multilateral trading system, such as non-discrimination, transparency, and predictability, helped to safeguard Korea's trading interests throughout the crucial development years. The multilateral trading system as represented by the GATT and the WTO must therefore

[34] *See* Chulsu Kim, *Super 301 and the World Trading System: A Korean View*, in JAGDISH BHAGWATI AND HUGH PATRICK, AGGRESSIVE UNILATERALISM 253–255 (1990).

be seen as one of the major contributing factors in the transformation of Korea from one of the poorest agrarian economies to the thirteenth largest trading nation in the world in less than four decades. Peter Sutherland, the former Director General of the GATT stated most clearly the benefits Korea received as a GATT Contracting Party:

> Korea's success has been built with hard work and skillful marketing; but its foundations are the market access opportunities and legal security provided by the GATT. One could almost say that the multilateral system had been tailored to Korea's needs, especially during the period of rapid industrial expansion from the early 1960s. Having secure access to the world market has encouraged the economies of scale and rapid reallocation of resources that have spurred Korea's phenomenal growth.[35]

The benefits of the Uruguay Round were felt mainly by the industrial sector in Korea. With the 38 percent overall reduction agreed in the round, the average tariff rate of industrial countries on manufactured goods has been reduced to four percent, and the proportion of industrial products entering developed countries duty-free has more than doubled, from 20 to 43 percent. At the same time, the overall reductions and the increase in tariff bindings undertaken by developing countries, particularly in Southeast Asia, Latin America and Central/Eastern Europe, were seen as creating new opportunities for Korean exporters. Sectoral tariff cuts negotiated in the chemical, steel and electronic industries were seen as particularly helpful in Korea: the proportion of trade in the chemical sector entering developed country markets duty-free more than doubled; tariffs on steel were to be eliminated in such markets as the United States, Australia, Canada, Japan, the EU and the EFTA countries; and tariffs on electronics were substantially reduced in Korea's major markets.[36]

Another aspect of the Uruguay Round market-access results seen as significant in Korea was the phase-out of gray-area measures such as voluntary export restraints. Korea had been adversely affected by such arrangements in footwear, electronics and steel in several of its major markets. These market-access results have led several research institutes in Korea to predict that the full implementation of the industrial package will add three to five billion dollars to the value of Korea's exports by 2002.[37] An OECD paper assessed the additional effect on Korea's economic growth at 2.3 percent.[38]

The other Uruguay Round results, such as the strengthened rules, the more effective dispute settlement system, and the establishment of the WTO as a stronger institution, were seen by many in Korea as bringing advantages to Korea. The perception was widespread in government, business and academic circles that Korea, as a heavily trade-dependant country, was in need of better protection by multilateral rules, and that the Uruguay Round results in these areas would meet this need.

B. Political Impact

However, these positive evaluations of the GATT and the WTO as well as of the Uruguay Round in general were completely overshadowed by the stormy political reactions in Korea towards the results of the agricultural negotiations, which were concluded in December 1993. While these results were seen internationally as relatively favorable for

[35] *Korea and the New World Trading System*, Address by Peter D. Sutherland, Director-General of the GATT, to the Korea Institute of International Economic Policy, Seoul, July 20, 1994, at 6.

[36] *Id*. at 3.

[37] *See* Choi, Nakgyoon, *supra* note 31, at 13.

[38] *See* Economic Planning Board, *et al*, Policy Responses to the Launching of the WTO 6 (1994).

Korea,[39] they were severely criticized and strongly opposed by well-organized farmer groups and the opposition political parties, both of which demanded renegotiation of the agreement. Violent nation-wide demonstrations by farmers followed.

The most controversial result was the required tariffication of all agricultural quotas. Korea had opposed such a result until the very end of the negotiations, but accepted it when all other countries did so. Korea had succeeded in exempting rice from tariffication until 2004, but agreed to open up the rice market under the minimum market access arrangement. The hostile reaction was so strong that President Kim Yong Sam had to appear before national television to seek support. In his statement of December 9, 1993, the President apologized for the failure of his government to resist opening the rice market in the Uruguay Round negotiations, but said that he had decided, after much soul-searching, that the acceptance of such results was a better alternative for Korea than refusing it and thereby being isolated from the GATT system.[40] The Prime Minister and the Minister of Agriculture subsequently resigned in order to take responsibility for the Uruguay Round results in agriculture.

In the spring of 1994, another domestic political controversy erupted over Korea's Country Schedule on agriculture. Certain aspects of the schedule submitted by Korea in March were rejected by its trading partners as not accurately reflecting the original agreement and as containing undertakings more favorable to Korea. When this became public, political criticism was leveled at the Korean negotiators for ineptness and for failing to have the schedules accepted in their entirety. The Minister of Agriculture and Fisheries was abruptly fired.

Compared to the political backlash from the Uruguay Round results in agriculture, the ratification process for the Marrakesh agreement in late 1994 was relatively smooth. The government introduced the ratification bill in the National Assembly on June 28, 1994. The minority opposition Democratic Party refused to participate in the discussions until late November when it made public four "preconditions" of participation in the ratification procedures. These preconditions called for the passage of special Uruguay Round implementation legislation in the National Assembly, the renegotiation of certain market opening conditions in the Uruguay Round with the United States, a unilateral declaration in the process of ratification to the effect that trade between North and South Korea be treated as internal trade, and finally, that a new economic support policy package for agriculture would be announced by the government.

The ruling party and the government accepted the idea of special implementation legislation as the United States and some other countries had similar legislation in place. The framework of the support package for the agricultural sector had already been announced in June. The government decided to provide 42 trillion Korean won (about $53.2 billion at the 1994 exchange rate) in structural adjustment programs in agriculture through 1998. In addition, 15 trillion Korean won (about $19 billion) would be used to enhance the competitiveness of the agricultural sector and to improve the standard of living in rural areas. The government stated that renegotiation of the Uruguay Round results would be impossible because the Round had ended, and a unilateral declaration on inter-Korean trade, as already agreed between North and South Korea in 1991, would only complicate Korea's WTO obligations.

[39] Charles Carlisle, the late Deputy Director-General of the GATT, who oversaw negotiations in agriculture in the late stages of the Uruguay Round, commented privately to the author that for him the results in agriculture were favorable to Korea. *See also*, Peter Sutherland , *supra* note 35, at 4.

[40] MINISTRY OF FOREIGN AFFAIRS, RATIFICATION PROPOSAL FOR THE WORLD TRADE ORGANIZATION AGREEMENTS at 205–216 (1994).

On December 15, 1994, the Foreign Affairs and Unification Committee of the National Assembly approved the WTO Agreement by eighteen to three. The Special Uruguay Round Implementation Legislation was approved unanimously after the original bill, which contained many provisions that conflicted with the WTO Agreement, was amended to comply with the WTO Agreements. The remaining provisions were mostly statements of principle. One of its provisions stated that "the transactions between North and South Korea are internal transactions, and therefore, are not considered as trade between countries stipulated in the [WTO] Agreement."[41] On December 16, the bill passed the Plenary Session of the National Assembly by 152 to 58, with one abstention. The Special Implementation Law also passed with a greater margin.

V. Korea's Involvement in the WTO Dispute Settlement System

Korea has been involved in a substantial number of disputes in the GATT and the WTO. Two cases were brought against Korea in the GATT, one under Article XXIII, and the other under the Anti-Dumping Code. Korea lost both of these cases.[42] Korea also lodged a complaint against the EEC on non-tariff barriers on television receivers. The case was resolved without a panel decision.

Since the establishment of the WTO, Korea has been a much more frequent user of the dispute settlement mechanism, and Korea's trade laws, regulations, and practices have also been challenged many times by other WTO Members. As of December 31, 2002, Korea had brought seven cases against its trading partners in the WTO dispute settlement process. Twelve cases (nine distinct matters) had been brought against Korea as of the same date. Korea has also participated in nine WTO dispute cases as a third party, and, as of December 31, 2002, Korea was participating as a third party in three additional cases.[43]

A. Korea as a Complainant

Six of the seven cases brought by Korea were against the United States. Three involved anti-dumping cases, two involved a safeguard action, and the sixth involved the U.S.

[41] Article 5, *Special Law Concerning the Implementation of the WTO Agreement*.

[42] The two cases were *Korea-Restrictions on Imports of Beef,* BISD 365/268 (United States), BISD 365/202 (Australia), and BISD 365/235 (New Zealand), (adopted on November 7, 1989); and *Korea-Anti-dumping Duties on Imports of Polyacetal Resins from the United States*, BISD 405/205 (United States), (adopted on April 27, 1993).

[43] The nine cases in which Korea participated as third party are: *Brazil—Export Financing Programme for Aircraft—Second Recourse by Canada to Article 21.5 of the DSU*, WT/DS/46/RW2 (2001); *Indonesia—Certain Measures Affecting the Automobile Industry*, WT/DS/54/R, WT/DS/55/R, WT/DS/59/R, WT/DS/64/R (1998); *European Communities—Customs Classification of Certain Computer Equipment,* WT/DS/62/AB/R, WT/DS/67/AB/R, WT/DS/68/AB/R (1998); *Canada—Certain Measures Affecting the Automotive Industry,* WT/DS/139/AB/R, WT/DS/142/AB/R (2000); *European Communities—Anti-Dumping Duties on Imports of Cotton-Type Bed-Linen from India (Article 21.5),* WT/DS/141/RW (2002); *India—Measures Affecting Trade and Investment in the Motor Vehicle Sector,* WT/DS/146/AB/R, WT/DS/175/AB/R (2002); *United States—Sections 301–310 of the Trade Act of 1974*, WT/DS/152/R (1999*); United States—Anti-Dumping Measures on Certain Hot-Rolled Steel Products from Japan,* WT/DS/184/AB/R (2001); and *United States—Continued Dumping and Subsidy Offset Act of 2000*, WT/DS/234/AB/R (2003). The pending or suspended cases where Korea reserved its rights as third party as of December 31, 2002 are: *United States—Definitive Safeguard Measures on Imports of Steel Wire Rod and Circular Welded Quality Line Pipe*, WT/DS/214; *United States—Sunset Review of Anti-Dumping Duties on Corrosion-Resistant Carbon Steel Flat Products from Japan*, WT/DS/244; and *European Communities—Provisional Safeguard Measures on Imports of Certain Steel Products*, WT/DS/260.

Table 1: WTO Dispute Cases Brought by Korea (As of December 31, 2002)

DS No.	Country	Case	Request for Consultation
89	United States	Anti-Dumping Duties on Imports of Color Television Receivers from Korea	July 10, 1997
99	United States	Anti-Dumping Duty on Dynamic Random Access Memory Semiconductors (DRAMS) of One Megabit or Above from Korea	August 14, 1997
179	United States	Anti-Dumping Measures on Stainless Steel Plate in Coils and Stainless Steel Sheet and Strip from Korea	July 30, 1997
202	United States	Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea	July 13, 2000
215	Philippines	Anti-Dumping Measures regarding Polypropylene Resins from Korea	December 12, 2000
217	United States	Continued Dumping and Subsidy Offset Act of 2000	December 21, 2000
251	United States	Definitive Safeguard Measures on Imports of Certain Steel Products	March 20, 2002

Continued Dumping and Subsidy Offset Act.[44] The seventh case was brought against the Philippines and involved an anti-dumping and countervailing law. In two cases the dispute was resolved when the defendant revoked the measures at issue.[45] In three cases the panel ruled in favor of Korea.[46] As of December 31, 2002, one appeal process[47] and one panel process[48] were underway. Table 1 summarizes the WTO dispute cases brought by Korea.

B. Korea as a Defendant

Of the twelve cases against Korea, six were brought by the United States, four by the EC and one each by Canada and Australia. Whereas Korea's cases against other WTO member countries were mainly in the area of import relief measures such as anti-dumping and safeguard measures, the complaints against Korea involved many areas of the GATT 1994 and WTO disciplines, such as the Agreement on Technical Barriers to Trade, the Agreement on the Application of Sanitary and Phytosanitary Measures, the Agreement on Agriculture, the Agreement on Government Procurement, the Agreement on Safeguards, the Agreement on Import Licensing Procedures, and the Agreement on Subsidies and Countervailing Measures.

[44] This statute, the so-called "Byrd Amendment", passed in late 2000, provides that antidumping and countervailing duties collected by the U.S. Government would be paid to the members of the U.S. industries that had supported the petition. *See* 19 U.S.C.§1675c.

[45] *United States-Anti-Dumping Duties on Imports of Colour Television Receivers from Korea*, WT/DS/89, and *Philippines-Anti-Dumping Measures regarding Polypropylene Resins from Korea,* WT/DS/215.

[46] *United States-Anti-Dumping Duties on Dynamic Random Access Memory Semi-Conductors (DRAMS) of One Megabit or Above from Korea*, WT/DS/99 (1999); *United States-Anti-Dumping Measures on Stainless Steel Plate in Coils and Stainless Steel and Strip from Korea*, WT/DS/179 (2001), and *United States—Definitive Safeguard Measures on Imports of Circular Welded Carbon Quality Line Pipe from Korea*, WT/DS/202 (2001). The Appellate Body generally upheld the panel in the latter case. The other two panel decisions were not appealed.

[47] *United States—Continued Dumping and Subsidy Act of 2000,* WT/DS/ 217.

[48] *United States—Definitive Safeguard Measures on Imports of Certain Steel Products*, WT/DS/ 251.

Table 2: WTO Dispute Cases Brought Against Korea (As of December 31, 2002)

DS No.	Complaining Country	Case	Request for Consultation
3	United States	Measures Concerning the Testing and Inspection of Agricultural Products	April 4, 1995

Korea resolved three disputes bilaterally with the United States, Canada and the EC.[49] Two cases involving the same matter brought by the United States against Korea were suspended when the United States did not take additional steps after it had requested consultations in 1995.[50] The panel ruled in favor of Korea in one of the remaining seven cases in which panel or Appellate Body reports have been adopted.[51] Five (three distinct matters) were decided in favor of the complainants and Korea fully implemented the DSB's recommendations in all of these cases.[52] In one case, the consultation process was underway at the time of writing.[53] Table 2 summarizes the WTO dispute cases brought against Korea.

The dispute settlement system of the WTO has been perceived as operating fairly in Korea. This is partly due to the fact that many of the cases brought by Korea against its trading partners, as well as one of the cases brought against Korea, were decided in Korea's favor. Even in those cases where the rulings have been unfavorable to Korea, the authority and the impartiality of the panel and/or Appellate Body have been rarely questioned. The *Alcoholic Beverages* case (DS 75 and 84) and the *Beef* case (DS 161), which had been decided against Korea, were high profile cases with significant political implications, but the public debate of these cases in the media and in the National Assembly has been largely confined to how to bring the domestic regulations and policies into conformity with the WTO recommendations, not whether the recommendations were fair.

VI. The New Trade Round (Doha Development Agenda) and Korea

Korea has been an unequivocal supporter of a new trade round from the very early stages of the discussions. According to a paper presented by the Ministry of Foreign Affairs and Trade, a new round is necessary "to maintain momentum for market opening, to keep rising protectionism in check, and to make the WTO more relevant to the globalization process."[54] Korea also supports a comprehensive agenda for the new round because it "will promise us a better balance of interests and therefore a better chance for success."[55] For Korea, a comprehensive agenda includes the built-in-agenda (agriculture and services), market access for industrial goods, anti-dumping, investment, competition policy, transparency in government procurement, e-commerce, and trade facilitation, among other matters. As of the end of 2002, the Korean government took the following positions on the various issues discussed in the context of the new multilateral trade negotiations.

A. Agriculture

Korea has taken a defensive position in agriculture as it did in the Uruguay Round. Korea is interested in maintaining the basic framework of the Agreement on Agriculture and supports a flexible gradual approach to liberalization to take into account the special nature of agriculture. It hopes to strengthen non-trade concerns, such as food security, environmental protection and rural development and the principle of special and differential treatment.

Korea's paper submitted in the first stage of negotiation well represented its position on the agriculture negotiation, stating that "a flexible and gradual approach is especially crucial for issues concerning tariff reduction and tariff rate quotas ("TRQs"), reduction of aggregate measurement of support ("AMS") and the criteria and scope of the Green Box."[56] It further stated that "provisions regarding non-trade concerns, including the multifunctionality of agriculture, and special and differential treatment for developing countries need to be revisited."[57] With regard to the market access of agricultural products, it proposed that "the framework of tariffication adopted at the Uruguay Round should be maintained in order to facilitate a consistent reform process." It further proposed that "tariff reduction should be based on the final bound rates of the Uruguay Round commitments so as not to penalize Member countries that have voluntarily reduced tariffs."[58]

B. Services

Korea is in favor of including all services sectors, reducing MFN exemptions in the existing agreement, and promptly concluding on-going work on rule-making in trade in services. Korea's proposal stated that "it is essential that no service sector be *a priori* excluded", and that "the scope of MFN exemptions should be progressively reduced."[59] Concerning rule-making in services, the proposal stated that "the Members should promptly conclude the work on rule making mandated by the GATS in the area of safeguard measures, domestic regulations, subsidies and government procurement."[60]

[60] *Id*.

Based on these objectives, a series of Korea's proposals were followed in the areas of telecommunication, distribution, financial, maritime and construction services, as well as on the principles of negotiation, including MFN exemption and autonomous liberalization. Through the process of exchanging concession requests, Korea requested concessions in various service sectors to 36 countries, and received concession requests from 24 countries, as of December 31, 2002.

C. Market Access for Industrial Goods

Korea supports substantial cuts in tariff rates on industrial goods and the reduction or elimination of non-tariff barriers. It also supports an increase in the number of tariff bindings and a formula approach for tariff reductions, with credits for unilateral tariff cuts. The Korean proposal stated that "the agreed modalities in the Market Access Negotiating Group should deal with the reduction and elimination of both tariffs, including tariff peaks, high tariffs and tariffs escalation, and non-tariff barriers as mandated in the Doha Ministerial Declaration."[61] With regard to the modality of the negotiation, it further stated that ". . . in order to bring about the greatest comprehensive tariff reduction for all Members, Korea prefers pursuing a formula approach, with limited use of the request-offer approach, when necessary."[62]

D. Anti-dumping

As in the Uruguay Round, Korea is in the forefront of those Members who support the inclusion of anti-dumping in the agenda for the new round. Korea is of the view that the Uruguay Round clarified some anti-dumping issues but that more needs to be done. Korea's interest lies in the elimination of ambiguities in the agreement and the stemming of abuse of anti-dumping measures by all countries. Korea proposed that the "negotiations for reviewing the AD Agreement should be conducted in the new round, with a view to preventing abuse of anti-dumping measures, thereby achieving a new balance of interests among all Members."[63] In particular, the Korean proposal calls for further clarification of rules in initiation of investigation and review procedures.[64] During the negotiation, Korea allied with other countries as a group of so-called "Friends of Anti-Dumping Negotiations", submitted several joint proposals for the WTO rules negotiation dealing with the possible clarification and improvement of the current Agreement. Korea and the Friends group countries also endeavor to add political momentum to the anti-dumping negotiation through senior level meetings, and encourage the developing Member countries to actively participate in the negotiation to prevent the proliferation of anti-dumping actions in world trade.

E. Regional Trade Agreements

Korea has a long-standing concern about the proliferation of regional trading agreements.[65] Its long-standing objective has been to ensure that the WTO rules on regional

[64] *Id*.
[65] However, as discussed in Part VII of this chapter, Korea is beginning to reevaluate its position with respect to regional trade agreements.

trade agreements are clarified in such a way that such agreements become consistent with the WTO and complement the work of the WTO. Korea has proposed that the new round deal with this issue. It has stated that "Article XXIV [of GATT 1994] suffers from a conspicuous lack of clarity that prevents members from reaching a common understanding on their exact meanings,"[66] and that the Committee on Regional Trade Agreements in the WTO " has yet to adopt a single examination report, and the systemic issues discussion has made little progress." Korea thus suggested that "Members review the WTO rules on regional trade agreements in order to clarify and strengthen them as necessary." Korea's "indicative list of particular interest" included, among others: developing yardsticks for "substantially all trade"; establishing the scope of "other regulations of commerce"; developing ways to measure "level of duties and other regulations of commerce," (all these terms are used in Article XXIV of the GATT 1994) and considering the relationship between Article XXIV of the GATT 1994 and Article 5 of the General Agreement on Trade in Services.[67]

F. Trade and Investment

Korea has been an active participant in the Working Group on the Relationship between Trade and Investment. Korea's Ambassador to Geneva was elected Chairman of the Working Group when it was established in 1997. Korea is of the view that negotiations in this area should aim at establishing WTO rules in investment in the form of a stand-alone multilateral agreement. This agreement "should aim at facilitating the flow of international investment through enhanced transparency and predictability." However, "[s]uch a goal should be reconciled with the need to respect the host country's right to set its own policies, in particular development policies of developing countries."[68] Most-favored-nation and national treatment should be adopted as guiding principles. The agreement should also establish a reasonably high standard of investment protection, but it should preserve the host country's right to regulate foreign investment according to its unique economic situation. It also called for consideration of performance requirements and investment incentives with a view to minimizing their distorting effects. As to dispute settlement, state-investor disputes should be excluded and the WTO dispute settlement procedures should be applied. Finally, the agreement should reflect the interests of developing countries.[69] After the negotiation began, Korea submitted proposals on non-discrimination and a GATS-type approach for investment,[70] and on balance-of-payment safeguard provisions in investment agreements.[71]

G. Trade and Competition Policy

Korea has taken the position that the time is ripe to begin negotiations on a multilateral framework on competition policy. A multilateral framework in this area "may provide a level playing field securing legal stability, predictability and transparency in world trade

[71] WT/WGTI/W/143, September 16, 2002.

and foreign investment, thereby helping enterprises to reduce transaction costs."[72] This framework should develop core principles and rules on competition policy and these principles and rules should be confined to areas where international trade and/or foreign investment are affected.[73] The framework should also aim at promoting cooperation among WTO Members in relation to competition cases. It should include modalities for international cooperation, such as prior notification of the enforcement of competition laws which may result in costs for other WTO Members, and coordination among the concerned WTO Members in cases where more than two jurisdictions are engaged in anti-trust investigations. Positive comity could also be incorporated into the framework to impose greater discipline on cross-border anti-competitive practices. Korea has also called for the incorporation of the developmental dimension as an integral part of the framework, and for a special dispute settlement mechanism to reflect the specificities of competition law. After the negotiation began, Korea submitted proposals on Hard Core Cartels and Voluntary Cooperation,[74] and on core principles of competition.[75]

H. Trade and Environment

Korea is in favor of placing trade and environment on the agenda of the new trade round. It believes that the WTO should try to ensure that trade-related environmental measures are implemented in a transparent, fair and non-trade restrictive manner. While Korea believes that the Members should review WTO rules relating to environment, health, and safety and clarify them as necessary, the result should not impede trade liberalization or advance protectionist purposes. Korea also supports the clarification of the relationship between the WTO and multilateral environmental agreements ("MEAs"), to improve the legal stability of the trade-related measures provided for in the MEAs in the context of the WTO legal framework. It also believes that eco-labelling can be useful in the protection of the environment, but that guidelines for its use should be established. Korea's submission to the Committee on Trade and Environment was intended to help facilitate further discussion by making preliminary identification of the Specific Trade Obligations as set out in MEAs and ascertaining some issues for further consideration.[76]

I. Trade Facilitation

Korea has supported the negotiation of trade facilitation issues in the new round. It believes that the WTO has a pivotal role to play in trade facilitation, in particular to coordinate the various efforts exerted by individual Members both at regional and multi-lateral levels. It called for the review of WTO agreements on import licensing and rules of origin in connection with trade facilitation, and hopes to discuss possible new rules in the areas of simplification and modernization, use of electronic media and Electronic Data Interchange, technical assistance to developing countries, and transparency of rules

[76] Committee on Trade and Environment, *Specific Trade Obligations (STOs)*, Submission by Korea, TN/TE/W/13, October 8, 2002.

and regulations on trade and custom procedures.[77] Especially, Korea's view is that Article V of the GATT sets out basic principles regarding transit traffic, but it does not provide detailed guidelines for applying these principles in practice. Furthermore, it does not give due consideration to the different risk levels involved in transit traffic, in particular, between transit with and without transshipment. Therefore, Korea is of the view that improving the implementation of Article V of the GATT is a vital component of trade facilitation.[78]

J. Other Issues

Of the other issues that are being discussed as possible subjects in the new round, Korea takes a positive view on electronic commerce. Korea believes that electronic commerce should be promoted through private sector initiatives, that government intervention should be kept to a minimum, and it is in favor of extending the current practice of not imposing custom tariffs on electronic transmissions until an appropriate point in time. Korea, as a new member of the Government Procurement Agreement was one of the early supporters of the Agreement on Transparency in Government Procurement. To facilitate concrete progress, Korea, Hungary and the United States have jointly submitted a draft text to the Chairman of the Working Group on Transparency in Government Procurement.[79] Korea has not spoken officially on trade and labor in the WTO, and is of the view that labor issues should be discussed in the ILO. However, given the political necessity that the industrial countries address this issue in some fashion, Korea appears to go along with the idea of discussing the issue outside the WTO and separately from the new trade round, with other international organizations such as the ILO.

VII. Regional Trade Agreements and Korea

Before a free trade agreement ("FTA") between Korea and Chile was initialed in October 2002, Korea was one of the very few WTO Members that had not entered into regional trade agreements ("RTAs"). This policy was based on the premise that as a nation trading globally, Korea's trading interests would not be promoted by membership in RTAs, and that such arrangements might lead to mutually exclusive trading blocs that could undermine the multilateral trading system. Korea has, however, participated in regional economic cooperation arrangements such as APEC for some time and has taken part in a limited number of preferential tariff arrangements such as the Generalised System of Preferences ("GSP"), Trade Negotiations among Developing Countries ("TNDC"), the Bangkok Agreement among Developing Member Countries of the Economic and Social Commission for Asia and the Pacific, and since 2000, unilateral tariff concessions to least developed countries.

The recent proliferation of RTAs seems to be changing the minds of Korean government policy-makers about membership in RTAs. RTAs are increasingly seen as an effective way of maintaining export markets and for inducing foreign direct investment

[77] Preparations for the Ministerial Conference, *Trade Facilitation,* Communication from Korea, WT/GC/W/309, September 2, 1999.

[78] Council for Trade in Goods, *Trade Facilitation : GATT Article V*, Communication from Korea, G/C/W/423, October 1, 2002.

[79] Preparation for the 1999 Ministerial Conference, *The WTO's Contribution to Transparency in Government Procurement*, WT/GC/W/385 and WT/WGTGP/W/27, November 9, 1999.

into Korea. There is also the growing concern that Korea might be left out of any RTAs altogether. This concern seems to have been reinforced by the decision of Japan to pursue FTAs of its own. The Government Report submitted to the Trade Policy Review of Korea in September 2000 clearly denotes this change in policy:

> As an economy that has benefited greatly from the openness in global trade, Korea has traditionally valued the multilateral trading system and has not supported bilateral or regional free trade agreements. Though its commitment to multilateralism is still firm, Korea has recently begun to be more flexible with regard to the FTAs in the world trading system. Korea is now of the view that FTAs, if properly concluded and managed in accordance with relevant rules, can supplement the multilateral trading system and contribute to market opening in the world through bilateral and regional acceleration of trade liberalization.[80]

The decision to pursue FTAs was made at the International Economic Policy Coordination Meeting chaired by the Prime Minister in November 1998. At this meeting, it was decided to pursue an FTA with Chile and to expand these negotiations on a step-by-step basis with other countries of similar size. The decision to pursue negotiations with large trading partners such as the United States, Japan and China would only be made after a careful study of the implications of such arrangements. A new inter-agency FTA Committee was created to oversee these negotiations.

The decision to pursue an FTA with Chile was taken by consensus in the International Economic Policy Coordination Meeting, but some participants appear to have raised concerns about the inclusion of agricultural products in the scope of the proposed FTA. Others questioned whether an FTA with a minor trading partner like Chile would be meaningful for Korea and urged that the government consider major trading partners like the United States, Japan and China as possible candidates.[81] Bilateral trade between Korea and Chile in 2001 amounted to $1.27 billion, consisting of $572.6 million of Korean exports to Chile and $696.1 million of Chilean exports to Korea.

Several considerations led to the choice of Chile. As a country that had implemented trade and economic reforms earlier than Korea, Chile was regarded as having similar views on matters related to trade liberalization. As a party to many existing RTAs and in the process of negotiating bilateral and regional trade agreements with various Latin American countries, Chile was seen as an ideal bridgehead for Korea into Latin America. The industrial structure of Korea and Chile was also regarded as complementary. Finally, since Chile has concluded or is in the process of negotiating FTAs with many countries, Korea could learn from its experience.[82]

The agreement to begin FTA negotiations between Korea and Chile was made between the two Heads of State in Auckland at the time of the APEC Summit in September 1999. The actual negotiations began in December 1999, and after six rounds of difficult negotiations, a FTA was initialed on October 24, 2002. The two nations concluded a comprehensive FTA with a high level of liberalization, involving not only goods but also a wide spectrum of issues like services, investment, intellectual property rights, and competition policy. The Korea-Chile FTA provides for the full elimination of tariffs on most imported products within ten years, with some exceptions. Depending on the sensitivity of the items, both countries agreed to introduce long-term elimination periods, tariff-rate

[80] *The Report by the Government, Trade Policy Review of Korea*, WT/TPR/G/19, August 28, 1996, at 16.

[82] *See* the Opening Statement by Eui-young Chung, Deputy Minister for Trade, in a Seminar, *The Meaning and the Implications of FTA with Chile*, jointly sponsored by Ministry of Foreign Affairs and Trade and Korea Institute for International Economic Policy, October 15, 1999 (paper).

quotas, preferential (seasonal) tariff rates and to leave out some items as exceptions to liberalization. For Korea, rice, apples and pears were set aside as exceptions and quotas are to be applied for beef, chicken and mandarin oranges. For Chile, refrigerators and washing machines were classified as exceptions to liberalization.

As of the end of 2002, a number of countries have been mentioned as additional candidates for FTAs with Korea. Among others, Japan, Australia, Singapore, New Zealand and Thailand have expressed interest in concluding FTAs with Korea or have officially proposed them. With respect to Japan, research on the feasibility of a bilateral FTA has been undertaken by research institutes in both countries.[83] The two countries launched in July 2002 a joint study group to exchange preliminary views on the possible agenda items in the official negotiations toward a bilateral FTA. Korea and Singapore also agreed in November 2002 to assess the feasibility of a bilateral FTA within the first half of 2003. Various research efforts are also being undertaken by research institutes, universities and business organizations in Korea, China and the United States on the impact of Korea-U.S.[84] and Korea-China FTAs,[85] but they have not yet resulted in government-level actions or discussions. As for the possibility of FTAs with Mexico, ASEAN and China, or a trilateral FTA among China, Korea and Japan, the Korean government will conduct a feasibility review through joint studies and other various channels.

VIII. Trade Policy Making in Korea

The executive branch of the Korean government makes most of the non-legislative trade policy decisions. The major trade policies are deliberated at the Economic Ministers' Meeting chaired by the Deputy Prime Minister, who is concurrently the Minister of Finance and Economy. Some policy matters are referred to the State Council presided over by the President, who is the ultimate decision-maker. The major administrative agencies that currently participate in the formulation of trade policy are the Ministry of Foreign Affairs and Trade, the Ministry of Finance and Economy, the Ministry of Commerce, Industry and Energy, and the Ministry of Agriculture.

Aside from the Ministry of Foreign Affairs and Trade, other ministries have domestic policy responsibilities over trade-related issues in various industrial sectors. However, the role and the relative importance of these ministries in trade policy-making have evolved over time in accordance with the changing nature of trade problems faced by Korea. In the early years of economic development, when trade policy issues centered around manufactured products, a major role was played by the Ministry of Trade, Industry and Energy. For many years, the negotiating functions tended to be divided among three ministries. The Foreign Ministry took the lead in multilateral negotiations, with the Trade and Industry Ministry taking the lead on sectoral negotiations, and the Finance Ministry being responsible for tariff policy and negotiations.

When trade talks diversified into other areas, a new institutional arrangement was required. The new International Policy Coordination Office was created in 1986 in the Economic Planning Board with the mandate of formulating long-term international economic policy and coordinating the government's positions on bilateral and multilateral

[83] Inkyo Cheong, *FTA Between Korea and Japan: Evaluation and Prospects*, Korea Institute for International Economic Policy Seminar (2000).

[84] Inbom Choi and Jeffry Schott, *Free Trade Between Korea and the U.S* (Institute for International Economics, 2001).

[85] Hu Angnag, *Proposition for Setting Up Free Trade Agreement (FTA) between China*, *Hong Kong, Japan and Korea*, Korea Institute for Industrial Economics and Trade Seminar, July 3, 2001 (paper).

economic issues.[86] A decision was not taken during the reorganization on who should take the lead in trade negotiations. As a result, the negotiation functions were divided mainly between the Ministry of Foreign Affairs and the Ministry of Trade and Industry (later, the Ministry of Trade, Industry and Energy), with the former usually taking the lead on multilateral trade issues, and the latter on bilateral and sector-specific issues involving manufactured products.

Since the 1980s, the organizational ambiguity concerning trade policy formulation and the Korean government's attribution of negotiating authority has been the subject of much criticism in Korea and the source of much inter-agency rivalry on trade policy questions since.[87] Under the administration of President Kim Young Sam (1993–1998), the name of the Ministry of Trade, Industry and Energy was officially changed to the Ministry of Trade and Industry, but this change did not affect the *status quo* on trade policy functions. Considerable debate and fractious maneuvering normally preceded the decision on which ministry should take the lead in trade negotiations.

Aside from the economic ministries, independent government commissions such as the Fair Trade Commission and the Korean Trade Commission take part in the formulation of trade policies. The Fair Trade Commission regulates unfair business practices. The Korean Trade Commission, established in 1987, independently makes determinations on the existence of injury in safeguard, anti-dumping and countervailing investigations and recommends appropriate remedies to the administration.

After the government of President Kim Dae-jung came into power in early 1998, the trade policy functions of government agencies were again reorganized. The trade policy functions, then dispersed widely in the Ministries of Foreign Affairs, and of Trade and Industry and Finance and Economy were given to the Ministry of Foreign Affairs, which changed its name to the Ministry of Foreign Affairs and Trade. This ministry was given the responsibility over the conduct of overall trade policy, including policy formulation, coordination and negotiation. The trade policy functions are now carried out by the Office of Trade Negotiations established within the ministry, headed by the Minister for Trade. The ultimate coordinating authority was given to the Prime Minister's Office.

In early 2001, in accordance with the reorganization of the administration, the Minister of Finance and Economy was elevated to the status of Deputy Prime Minister as under previous governments. The economic policy coordination functions were re-entrusted to the Deputy Prime Minister, as the Chairman of the Economic Policy Coordination Meeting. In July 2001, the government announced that a special ministerial level meeting dealing with international economic policy would be held under the Chairmanship of the Deputy Prime Minister and composed of the Minister of Agriculture, the Minister of Commerce, Industry and Energy, the Minister of Administrative Coordination, the Minister for Trade, and the Chief Economic Secretary to the President.[88] This meeting will replace the International Economic Policy Coordination Meeting chaired by the Prime Minister. The International Economic Policy Coordination Meeting was to be supported by a vice-ministerial level meeting headed by the Minister for Trade.

The political parties and the NGOs also play an important role in trade policy formulation in Korea. The government and the ruling party consult on major trade policies. The ruling party often provides input on trade policy, particularly in politically sensitive areas, through the Party-Administration Policy Coordinating Meeting. Increasingly,

[86] *See Trade Policy Review of Korea*, Report by the Government, GATT C/RM/G27, June 12, 1992, at 21.

[88] Press Release, Ministry of Finance and Economy, July 17, 2001.

government think-tanks, economic organizations, labor unions and consumer, environmental and farmers' organizations are involved in developing positions on trade-related matters and try to influence the government's position in these areas.

On important trade policy matters, inter-agency committees are formed to develop, coordinate and establish trade policies. One such example is the standing New WTO Round Committee, which was established in 1998. Headed by the Deputy Minister for Trade in the Ministry of Foreign Affairs and Trade, the Committee was created to prepare Korea's positions in the new round. Five subcommittees, on manufactured products, agricultural products, services, rules, and new issues, were also organized to facilitate the work of the Committee. Government officials, economic organization representatives, and trade policy experts are included in these subcommittees. It has organized public hearings for civic, social and economic groups in order to properly reflect their views in the negotiation process.

IX. Conclusion

In its thirty-six year history of membership in the GATT and the WTO, Korea has risen from a minor trading nation to a major one. Concomitantly, Korea's role in the GATT/WTO system has evolved from an obscure to a prominent one. At the same time, Korea has benefited immensely from the international trading system represented by the GATT and the WTO. Although the GATT was often an imperfect system, there is no question that it provided the stability, predictability, and market access that were all crucial in the development of Korea's exports.

As a developing country, Korea's contribution to the GATT system was relatively slight until the mid-1980s when Korea's trading partners began to demand market-opening measures, bilaterally and multilaterally. Korea's decision to disinvoke BOP restrictions in 1989 was an important step to begin the liberalization of hardcore restrictive measures, particularly in agriculture, and the Uruguay Round results a few years later brought about further liberalization of the trade regime in this sector. In non-agricultural areas, Korea's contributions in the Uruguay Round were substantial. Korea played a significant role in the Uruguay Round, commensurate with her status in world trade.

Since the establishment of the WTO, Korea has been an active and prominent player in all aspects of the activities of the organization. It has faithfully implemented its WTO obligations. In the sectoral negotiations during the early years of the WTO, such as in financial services, in basic telecommunications and in information technology products, Korea has been a key player and substantial contributor. Korea has also recently introduced significant tariff concessions towards the Least Developed Countries. Korea has been an active participant in the dispute settlement process of the WTO, and has shown itself to be a responsible WTO Member by implementing all Panel/Appellate Body recommendations. It is also important to note that the WTO system demonstrated its value to Korea during the Asian financial crisis, which engulfed the country in late 1997. The Korean recovery from the crisis was largely trade-driven, and this was possible because the overseas markets for Korean products remained open as Korea's trading partners resisted protectionist measures.

Korea has been a vigorous supporter of a new trade round with a comprehensive agenda. In the on-going trade round known as the Doha Development Agenda, Korea is likely to play an even more active role than in the Uruguay Round. Korea continues to have an important stake in a more open and rule-based international trading system. As Korea's trade regime continues to be more open and liberal, the new WTO round is

unlikely in most areas to create new obligations that will be politically difficult for Korea to bear. In agriculture, however, difficulties remain, and substantial opposition to rapid liberalization in this sector is expected. A delicate balancing act by the government will be required between the need to meet the eventual negotiating objectives in agriculture and the political requirement at home to bring about progressive liberalization. However, even with this caveat, the likelihood is great that Korea will remain a strong guardian of the WTO system and an active supporter and participant in the on-going round of trade talks.

I. Introduction

Mexico is the world's seventh largest trader and by far the most important in Latin America. It participates actively in multilateral trade negotiations, and has been one of the most dynamic participants in regional trade agreements. Currently, more than seventy percent of the country's GDP derives from trade.[1]

The present situation stands in stark contrast to Mexico's trade policies of relatively recent times. In 1982 it still had a closed economy, and it did not join the GATT until 1986. Even in 1980, during the oil boom, its exports amounted to only US$25 bn. (compared with US$166 bn. in 2000), and they accounted for only thirteen percent of GDP.[2]

This chapter provides an overview of Mexico's role in the multilateral trading system, following its transition from a closed economy to its current status as a leading actor in world trade. Part II covers Mexico's long-delayed decision to join the GATT and Part III deals with its participation in the Uruguay Round. Mexico's experience with dispute settlement under GATT/WTO is addressed in Part IV, and its objectives for the Doha Development Agenda are dealt with in Part V. Part VI covers Mexico's very active participation in regional trade agreements. Parts VII and VIII deal, respectively, with the trade policy formulation process in Mexico and political attitudes toward the WTO. Part IX provides a conclusion.

II. A Long and Winding Road: Mexico's Accession to the GATT

A. The Havana Conference

Mexico followed an activist foreign policy in the aftermath of World War II, becoming a founding member of the United Nations, the IMF and the World Bank. Its participation in the United Nations Conference on Trade and Employment, held in Havana, Cuba, from November 1947 to March 1948 is thus not surprising. It was during the conference that what eventually became known as the Havana Charter, under which the International Trade Organization ("ITO") was to be established, was proposed. The Charter and the ITO never entered into force, largely as a result of lack of support by the United States.

Mexico decided not to ratify the Havana Charter or to participate in the GATT. The reasons for not ratifying the Charter were explained by Mexico's Finance Minister, Mr. Ramon Beteta, in his speech before the Conference on November 26, 1947.[3] Instead of assessing the strengths and weaknesses of the Charter, Mr. Beteta dwelled on its alleged omissions. He argued that the Charter's aim was to foster trade at the cost of ruining many national industries, instead of promoting trade through the harmonious growth of national economies. The Charter did not recognize the different implications of trade restrictions implemented by net debtors which merely wished to protect their currency and overall economic stability, and those imposed by net lenders, which were protecting a strong industry and agricultural sector, making it virtually impossible for the debtors to pay them back. The Charter provided no specific strategies to foster employment growth or economic development in developing countries, nor did it eliminate export subsidies or provide the means for dealing with cartels and oligopolistic practices. It did

[3] A summary of the speech is presented in Luis Malpica de Lamadrid, ¿Qué es el GATT? Las Consecuencias Prácticas del Ingreso de México al Acuerdo General 15–17 (1988).

not outlaw dumping and at the same time placed restrictions on anti-dumping actions. The concomitant tariff reductions would make foreign investment in industrializing countries less attractive. The Charter permitted control over prices and supplies of commodities and raw materials and allowed absolute freedom for prices and supplies of manufactured and consumer goods.

In short, Mr. Beteta argued that the Charter favored developed countries at the expense of developing ones, and that under such circumstances it was best for Mexico not to ratify the Charter and join the ITO.

B. The 1970s: Postponement of Mexico's Accession to GATT

Mexico remained a basically closed economy from the post-World War II era up until the mid-1980s. It would take two economic shocks for trade policy to be altered in a significant way: a severe economic downturn in 1982–1983 caused by a drop in the world price of oil and a rise in worldwide interest rates (which put Mexico on the verge of defaulting on its foreign debt), and a second economic downturn in 1986 coupled with a stock market crash and a devaluation of the peso in 1987.

From the late 1940s until the mid 1970s, the basic thrust of trade policy was the use of high tariffs and import licensing requirements for a broad range of products, with the aim of fostering import-substituting industrialization ("ISI").[4] The policy was very successful, especially from the mid 1950s until the early 1970s. Mexico's economy grew at an annual average rate of 6.8 percent from 1958 to 1970, surpassed only by Japan, Singapore and South Korea. In fact, if one were to take the parameters established for membership in the European Monetary Union (the Maastricht convergence criteria), Mexico would have qualified for entry into the Euro zone.[5]

Trade volumes were very low throughout the period, accounting for less than fifteen percent of GDP, and about three-quarters of total exports were made up of agricultural goods and minerals.[6] During that time, however, the government initiated a series of programs that many years later became an integral part of the export-led strategy and contributed to the generation of foreign exchange. The most important programs related to the automobile industry, *maquiladoras* (in-bond processing plants), and investment in infrastructure and regional development to foster international tourism.[7]

The achievements of the 1950s and 1960s provided a firm basis from which to start a gradual process of trade liberalization and export promotion, but the policies followed from the early 1970s to the early 1980s were, at best, contradictory and erratic, plunging the country into economic crisis in 1976 and again in 1982.

[4] ISI was also pursued before that time, but more as a default option resulting from dire international economic circumstances in the 1930s than as a clearly laid-out strategy. *See* Leopoldo Solís, La Realidad Económica Mexicana: Retrovisión y Perspectivas (1991).

[5] Using 1996 figures for targets that depend on the best performers in the European Union, the convergence criteria and Mexico's performance are, respectively, as follows: inflation (2.7 percent vs. 2.5 percent), total debt as a percentage of GDP (60 percent vs. 14.4 percent), public sector deficit as a percentage of GDP (3 percent vs. 2.6 percent), interest rates (9.2 percent vs. 8.2 percent), and exchange rate fluctuation (15 percent vs. 0 percent). Antonio Ortiz Mena, El Desarrollo Estabilizador: Reflexiones Sobre una Época 289 (1998). (Note: Antonio Ortiz Mena is not to be confused with his grandson Antonio Ortiz Mena L.N., the author of this chapter.)

The Echeverria government (1970–1976) decided to give an impetus to exports and to rationalize protection, in order to reduce the anti-export bias of the prevailing export structure. Regarding the latter, the first stage contemplated a reduction in tariff dispersion (i.e., the number of different tariff rates applied, and the range from the lowest to the highest tariff), the second one a reduction of quantitative restrictions, and the third one an eventual reduction of tariffs, including the highest ones covering industrial goods. There was limited success in the areas of tariff dispersion and quantitative restrictions, but the third phase never came into effect.[8]

As for export promotion, in 1971 the Mexican International Trade Institute (*Instituto Mexicano de Comercio Exterior*), an independent government agency, was created and its activities, together with fiscal incentives for exporters, contributed to export growth (an increase of 123 percent from 1970 to 1975)[9] and to a change in the export structure, so that by 1974 fifty percent of Mexico's exports were made up of manufactures, up from only 11.6 percent in 1958.[10]

The experiment with export promotion and the rationalization of protection was short-lived, given that these policies were pursued within a context of erratic macroeconomic management. Between 1971 and 1976, annual inflation rates increased from 5.3 percent to 15.8 percent, the public sector deficit ballooned from 0.9 percent to 7.4 percent of GDP, the current account deficit increased from 2.4 percent to 4.1 percent of GDP, and the public foreign debt grew from US$4.5 bn. to US$19.1 bn.[11] A balance of payments crisis in August 1976 forced the government to devalue the peso, which had remained at a fixed parity with the U.S. dollar since 1954. Stabilization measures included an increase in export taxes, as well as reinstating import permits for products that had previously been liberalized, so that by the end of the Echeverria administration ninety percent of imports were so covered, and the export promotion program started in 1971 was suspended.[12]

Apart from an economic crisis, the Lopez Portillo administration (1976–1982) inherited a commitment with the IMF to stabilize the economy. Under the IMF agreement, Mexico was to receive U.S.$965 million in exchange for reforms aimed at reducing inflation, decreasing the current account deficit, and restoring conditions conducive to a resumption of growth. Among the measures implemented were the imposition of new export taxes (to avoid windfall profits resulting from the peso devaluation), but also the dismantling of certain import licensing requirements. By late 1978 the program seemed to be having a positive effect, with decreasing inflation and a lower current account deficit.

Trade policy reform was spurred by IMF conditionality, increasing U.S. protectionism (which threatened to reduce Mexico's benefits under the Generalized System of Preferences), and the need to have a coherent trade policy after the policy swings of the Echeverria era. The trade reforms pursued from 1977 to 1980 consisted of export promotion through fiscal, financial and energy subsidies, available as a result of the rise in the price of oil, which was becoming increasingly important for the Mexican economy after the discovery of significant reserves in the mid-1970s. There was also some

[12] Flores, *supra note* 8, at 184–193.

liberalization; import licensing requirements decreased from ninety percent at the end of the Echeverria administration to sixty percent by 1980, and quantitative restrictions were to be completely phased out by 1982.

GATT accession became a key element of trade policy reform. In 1978 the U.S. government, wanting to avoid a permanent trade deficit with Mexico, which it believed would become unavoidable if its southern neighbor continued to increase its oil exports to the United States and maintained a closed economy, issued "emphatic invitations" for it to join GATT before the end of the Tokyo Round (1973–1979) and to open up its economy.[13] The issue had lain dormant since the 1948 decision not to ratify the Havana Charter, but had slowly come back to life. In 1964 the United Nations Conference on Trade and Development ("UNCTAD") was established. It was seen as the natural forum for developing countries, whereas GATT was regarded as a forum where developing countries would be begging for scraps from rich countries.[14]

As a result of the Third UNCTAD meeting in Chile in 1972, there was agreement to allow developing countries to participate in trade negotiations without the need for GATT membership, and Mexico in fact participated in preparatory meetings for the Tokyo Round, as well as in the Round itself. It became increasingly evident that UNCTAD was becoming more of a consultative and research-oriented forum, and that significant trade concessions would be obtained only in the GATT. Accordingly, during the Tokyo Round Mexico assumed certain commitments in principle, and its representatives believed it was only logical for Mexico to negotiate accession in order to receive improved market access as a result of GATT membership.[15]

During the early stages of the Tokyo Round, an Office for Trade Negotiations and Tariffs was established at the Finance Ministry, as well as an inter-ministerial commission dealing with the same topics. The commission was formally presided over by the Finance Minister (Lopez Portillo) but in practice was headed by Hector Hernandez, Director of Financial Studies at the Finance Ministry. The incipient interest in the GATT was maintained when Lopez Portillo became President in 1976. Hector Hernandez was made Deputy Minster for Foreign Trade, and in January 1979 he was finally instructed to begin negotiations for GATT accession. Abel Garrido, as Director of International Affairs at the Trade Ministry, was directly in charge of negotiations, which were successfully completed within a relatively short time span.[16]

In a letter addressed by Mexico's Trade Minister, Jorge de la Vega Dominguez, to Olivier Long, Director-General of the GATT at the time, it was made clear that Mexico would accept accession only insofar as three basic principles were upheld: that it should be recognized as a developing country, that it be allowed to implement the measures required to achieve the aims of its economic and social development policies, and that its commitments during the Tokyo Round be considered part of the concessions given for GATT accession. A Working Group made up of Argentina, Australia, Brazil, Canada, the European Economic Communities ("EC") and its Member States, Egypt, Spain, the United States, India, Japan, New Zealand, Nicaragua, Peru, Romania, Sweden, Switzerland and Uruguay, and presided over by Dr. P. Tomie from Yugoslavia, examined Mexico's request.

[13] FLORES, *supra* note 8 at 203.
[14] Interview with Dionisio Meade, February 12, 2002.
[15] Interview with Fernando de Mateo, January 10, 2002.
[16] Interview with Luis Bravo Aguilera, February 11, 2002.

The Working Group met on five occasions, and on October 26 the Protocol of Accession was ready. It completely fulfilled all of the requirements set out by Mexico in the letter to Mr. Long. Mexico's industrial promotion strategy was left intact, even though it was inconsistent with several of the new GATT Plurilateral Codes of Conduct; it allowed the government to maintain export subsidies for a certain time; it provided ample protection for the agricultural sector and the highly regulated automobile industry; and the oil industry was kept completely out of the Protocol.[17] Mexico granted tariff concessions on three hundred products with an import value of US$504 million at 1976 prices (eight percent of total imports), and bound tariffs at a higher level (fifty percent) than the currently applied ones. In exchange, it received concessions for 373 products with an export value of US$1,916 million and an average tariff reduction of 34 percent.[18] In addition, Mexico could make ample use of GATT safeguard provisions (Articles XII and XVIII) to deal with balance-of-payments problems should the need arise, as India and Brazil had been doing for a long time.[19]

The very successful negotiations, however, were sidelined by an acrimonious debate involving government officials, politicians, academics, public intellectuals, and business leaders, among others, on the merits of GATT accession that continued throughout 1979 and early 1980. The debate went on for a long time without knowledge of the specific conditions for accession that would be requested or the concessions to be gained by Mexico!

In April 1979, during its Third Annual Congress, and in the presence of President Lopez Portillo, the National College of Economists ("CNE") expressed concern over the consequences of Mexico's entry into GATT, chief among them that it would represent a threat to the sovereign management of trade and industrial policy and provoke serious dislocations in the Mexican economy. President Lopez Portillo replied that the economists who had previously criticized the ISI strategy, arguing it had run its course, now opposed policy change. He asked for constructive proposals, rather than mere criticism. In May the CNE replied in the national media, stating that accession to GATT should be postponed indefinitely given that the national economy was not ready for increased foreign competition, and that the existing trade policy instruments were adequate to combat the prevailing anti-export bias. In arguments reminiscent of those used some thirty years earlier by Finance Minister Beteta, the CNE also claimed that the GATT was ineffective in dismantling protectionism and did not deal effectively with the needs of developing countries.[20]

During the following months there was a plethora of meetings, declarations and articles on the relative merits and demerits of GATT accession. Trade policy issues did not make the front pages again until the North American Free Trade Agreement ("NAFTA") negotiations started in the early 1990s.[21]

[17] Flores, *supra* note 8, at 240–241.

[18] De Mateo, *supra* note 10, at 47–48. A comparison between the 1979 and the 1986 Protocols is presented in Gabinete de Comercio Exterior, El Proceso de Adhesión de México al Acuerdo General Sobre Aranceles Aduaneros y Comercio (GATT) 233–241 (1986).

[19] De Mateo, *supra* note 15. Nora Lustig, Mexico: The Remaking of an Economy (1992) notes that at the time Mexico lacked anti-dumping and countervailing duties laws, but in my view those laws could have been enacted without much trouble, given the hold of the ruling Institutional Revolutionary Party ("PRI") over congress, and the President's de facto mandate over PRI issues.

[20] Flores, *supra* note 8, 238–239.

[21] Malpica de Lamadrid provides a good summary of the debate. *See* Luis Malpica de Lamadrid, *La Consulta Nacional 1979–1980: Polémica*, *supra* note 3.

The private sector was not unduly concerned about entry into GATT. The most intense debates occurred among government officials, and they were not really about entry into GATT but about the economic development model in general: whether to stick with state-led interventionism and a relatively closed economy which awarded pride of place to oil, or to start a process of serious economic reform, including privatization and liberalization. Positions were held on principle and there were abstract discussions on national sovereignty; scant attention was paid to the actual Protocol of Accession.[22]

The debate on GATT accession was a "lightning rod" for a much larger and general debate on national development strategies that pitted those favoring a generally interventionist approach within a closed economy, against those favoring economic liberalization. The discussion was very doctrinaire, so that specific issues were rarely examined in a systematic and objective manner.[23]

In an unexpected move right after the successful negotiation of the Protocol, Lopez Portillo decided to initiate a series of national hearings with representatives from trade and industry on the wisdom of ratifying the Protocol. Some people close to the process have ventured that the President had already decided against GATT accession, and that the consultations were window-dressing on a *fait accompli*; that is, the consultation process conveyed legitimacy to the decision, but did not cause it.[24]

The cabinet was divided over economic policy issues, and these divisions became greater as the international price of oil rose. Jose Andres de Oteyza, Secretary of Patrimony and Industrial Development (*Patrimonio y Fomento Industrial*), argued that oil should be used to the country's advantage as bargaining leverage in bilateral trade negotiations. World Bank estimates indicated that the price of oil would continue to rise, perhaps reaching US$50 per barrel in the not too distant future, so at the time the decision to go it alone did not seem as reckless as it turned out to be. More generally, it was thought that with the oil bonanza Mexico need not submit its development plans, which included subsidies for a number of "strategic" sectors, to multilateral trade rules that would have hindered the execution of an activist policy.

The President then decided to put the matter to a vote, in writing, to the eight Ministers who comprised the Economic Cabinet, i.e., Finance, Programming and Budget, Trade, Patrimony and Industrial Development, Foreign Relations, Interior, Labor, and Agriculture. The vote, a non-binding and informal procedure, was cast in March, and the result was 5 to 3 against GATT accession.[25]

On March 18, 1980, President Lopez Portillo made public his decision to postpone GATT accession. He chose a highly symbolic date, the anniversary of the nationalization of the oil industry on March 18, 1938. The implications escaped no one: it was implicit that membership of the GATT would have meant a threat to national sovereignty.[26]

The President stated that it was not the appropriate time to join the GATT. Among the reasons for his decision, he stated that the World Energy Plan proposed by Mexico and under discussion at the United Nations could be incompatible with some GATT

[22] Bravo Aguilera, *supra* note 16.

[23] Meade, *supra* note 14.

[24] De Mateo, *supra* note 15. Flores, *supra* note 8, at 240, concurs with this view.

[25] FLORES, *supra* note 8, at 248. Apparently, Trade, Programming and Budget, Interior and Labor were in favor, while Foreign Relations, Finance, Patrimony and Industrial Development, and Agriculture were against it. According to Bravo Aguilera, *supra* note 16, some ministers that had been in favor of accession changed their minds at the last minute in line with what they surmised were the President's true preferences.

[26] Meade, *supra* note 14, De Mateo, *supra* note 15.

provisions, such as those related to commitments on supply,[27] that trade liberalization did not translate into a fairer world economic order, and that bilateral negotiations were preferable to multilateral ones as a way to start building such an order. He went on to say that the crux of the matter was the "philosophy" of the GATT itself, and not the excellent Protocol obtained by Mexican negotiators.[28]

The date chosen for the speech also meant that oil would maintain pride of place in the national quest for economic development. The oil boom made the government set aside the cautious reforms (including trade policy reform) initiated under IMF conditionality and embark on a strategy for growth whose success depended on the evolution of two key variables that were beyond its control: the persistence of an upward trend in the price of oil (or its stabilization at high levels), and the continued availability of foreign financing at low interest rates.

The 1978–1981 period was one of impressive economic growth based on oil exports: GDP grew at more that eight percent per annum, oil production increased annually at 19.4 percent and oil exports outpaced the increase in production, growing at a 52.7 percent annual rate.[29] The cost of the strategy was extremely high, however, as became all too evident by the summer of 1981.

Instead of addressing severe macroeconomic imbalances (the current account deficit grew by 68.9 percent in 1978 and 80.9 percent in 1979) through exchange rate policy (a devaluation), a tightening of monetary policy or other policy options, the government did not change course. The strategy started to unravel by mid-1981 with a decrease in the price of oil. To make up for the gap in revenue, the government started to take on short-term debt at ever increasing interest rates, so that the debt was in fact fueling a capital flight spiral.

Secretary Oteyza, who supervised oil policy, behaved as if Mexico were a price maker instead of a price taker in the international oil market, and threatened that countries unwilling to buy oil at the previously agreed upon high prices would have their supply contracts rescinded. Several countries were only too glad to end their contracts and to seek suppliers at much lower costs.[30]

The situation became untenable and on February 19, 1982 the President decided to devalue the peso. He arrived at the decision on his own, after the Governor of the Central Bank had insisted on it for months. The devaluation, however, was not accompanied by sensible policies to lessen its costs and make the most of its benefits. It was soon followed by an increase in the minimum wage, which generated inflationary pressures and largely offset the advantages gained by the devaluation. It also created uncertainty and further pressures on the peso. Exchange controls were imposed on September 1, and the banks were nationalized.

President Lopez Portillo bequeathed his successor, Miguel de la Madrid (1982–1988) what he had inherited from Echeverria: an economy in crisis and under IMF surveillance, with many necessary reforms, including trade policy, still pending. A great opportunity had been lost, and now policy change would have to be undertaken under dire economic circumstances.

[27] Lopez Portillo did not make a more explicit reference regarding supply conditions, but he was probably referring to GATT rules against restrictions on exports.

[28] The March 18, 1980 speech by Lopez Portillo is summarized in Luis Malpica de Lamadrid, *La No Entrada de México al GATT en 1980, supra* note 3.

[29] Ortiz Mena L.N., *supra* note 11, at 40.

C. The 1980s: Unilateral Trade Liberalization and (Finally) Accession to GATT

After the 1982 economic crisis the policy emphasis was on macroeconomic stabilization and later on re-igniting economic growth. Trade policy became an instrument for both goals. By the time Mexico decided to start GATT accession negotiations in late 1985, national economic circumstances had changed drastically from those prevalent in the immediate aftermath of the 1982 crisis, and the country was set on a course of unilateral trade liberalization that dovetailed with the terms of the negotiated GATT accession.[31]

Almost two years of the De la Madrid administration went by until the first significant changes in trade policy were implemented. In December 1984, import licensing requirements were removed for seventeen percent of imports, although that still left 83 percent of imports subject to licensing requirements given the one hundred percent import licensing coverage imposed in 1982. The simple average tariff was reduced by 13.7 percent, and the number of tariff positions was reduced from sixteen to ten. The following year saw a very significant reduction in import licensing requirements, so that only about one-third of imports faced such restrictions. The maximum tariff nevertheless remained at one hundred percent, and the percentage of production covered by reference prices (i.e., official prices set by the government) almost doubled, from 13.4 percent in 1984 to 25.4 percent in 1985. Further liberalization had to await a deepening of the crisis and the long-postponed decision to join the GATT.

The initial stabilization program was not successful insofar as inflation remained high and renewed economic growth was not forthcoming. Further trade reforms were implemented in 1985, in the midst of a balance of payments crisis. The original trade reform program contemplated eliminating import licensing requirements for 35 percent to 45 percent of total imports by the end of 1985, but under the adverse circumstances the government decided to liberalize 64.1 percent of total imports by that date.[32] Protection for domestic producers was secured through an increase in some tariffs.[33]

The situation deteriorated from 1985 to 1986, especially given the drastic reduction in oil prices, which went from US$25.50 a barrel in 1985 to US$10 a barrel in 1986, greatly affecting the ability of the Mexican government to service its foreign debt, given that in 1985 more than two-thirds of total export revenues derived from oil. The government used exchange rate policy to help boost non-oil exports, decreasing the real controlled exchange rate of the peso against the dollar by 46 percent in 1986.

During this time a crucial shift in the composition of exports took place, partly as a result of trade liberalization, partly given the drastic decline in oil prices, and partly due to the new stabilization program that used a strategy of making dollars increasingly more expensive in terms of the peso. In 1985, over two-thirds of export revenues derived from oil exports; by 1986 that figure had been reduced to forty percent. Non-oil exports rose by 41 percent during that same short period.[34]

[31] Lustig, *supra* note 19, provides an excellent overview of Mexican economic reforms during the De la Madrid administration. Regarding trade policy reform, *see* ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT (OECD), TRADE LIBERALISATION POLICIES IN MEXICO (1996). An influential diagnosis of the Mexican economy in the early 1980s and a cogent program for a turn toward renewed growth based on a more open economy and export growth is BELA BALASSA, GERARDO M. BUENO, PEDRO-PABLO KUCKZINSKI AND MARIO HENRIQUE SIMONSEN, TOWARD RENEWED ECONOMIC GROWTH IN LATIN AMERICA (1986).

[32] LUSTIG, *supra* note 19, at 39.

[33] The average tariff increased from 21.8 percent in mid-1985 to 25.2 percent by the end of that year (LUSTIG, *supra* note 19, 118).

[34] LUSTIG, *supra* note 19, 45.

The rapid pace of unilateral liberalization in 1985 led the government to renew actions geared at GATT accession. The argument made by proponents of accession was that, since Mexico was already liberalizing on a unilateral basis, it might as well receive some concessions in return through GATT accession.[35] Accession would also help to give more credibility to the permanent nature of Mexico's economic reforms, much as NAFTA would do later on. Despite these arguments, it would seem unwise for a country to liberalize unilaterally just before it is about to undertake trade negotiations.

While Mexico had twice decided not to join GATT under relatively propitious economic circumstances, it finally decided to do so in the midst of dire economic straits, and as part of an overall economic reform program aimed at stabilizing the economy and introducing reforms to allow the resumption of growth.

The policy shift was the result of a pragmatic decision by the government largely forced upon it by the prevailing economic circumstances; there was no significant business sector pressure in favor of trade liberalization.[36] In fact, in 1987 the government went significantly beyond its GATT commitments when it pursued unilateral liberalization as part of further stabilization efforts, for instance by establishing a maximum tariff of twenty percent (as opposed to the fifty percent GATT binding commitment). Business leaders were not consulted about the 1987 decision, which went against previous commitments made to them in terms of the pace and depth of liberalization. The experience made business representatives extremely wary of government actions in the trade policy arena. When in 1991 the government announced its intention to negotiate a free trade agreement with the United States, business leaders recalled the post-GATT unilateral liberalization and demanded a say in trade policy negotiations and implementation.

The decision to join GATT was not contained in the National Development Plan. However, once the president decided to significantly liberalize the economy in 1985–1986, Trade Minster Hector Hernandez approached him and argued that this would be a good time to finally seek accession to the GATT.[37]

President De la Madrid agreed with the proposal and asked the Senate to organize hearings on GATT accession. The Senate was controlled by the PRI, so the thrust of its recommendations after the hearings was a foregone conclusion.[38] It was a mere formality, which contrasted with President Lopez Portillo's strategy to politicize the decision by fostering discussion in the press and among interest groups.

The hearings took place from late October to mid-November 1985. The Senate's unanimous conclusions and recommendations in favor of GATT accession were published in the official newspaper (*Diario Oficial de la Federación*) on November 22, 1985.

On that same day President De la Madrid instructed Trade Minster Hernandez to begin GATT accession negotiations, and indicated that for the Protocol to be acceptable for Mexico it should allow the full implementation of the National Development Plan, the frame of reference should be the 1979 Protocol, Mexico should be recognized as a developing country, absolute respect for Mexico's sovereignty over its energy resources must be maintained, the special character of the agricultural sector must be recognized, and sensitive agricultural products, such as maize, must be excluded from the negotiations.[39]

[35] Bravo Aguilera, *supra* note 16.

[36] De Mateo, *supra* note 15. FLORES, *supra* note 8, takes a different view, and argues that the shift in trade policy had a significant impetus from business sectors looking for secure access to new markets.

[37] Bravo Aguilera, *supra* note 16.

[38] For an overview of the Mexican political system, *see* WAYNE A. CORNELIUS, MEXICAN POLITICS IN TRANSITION: THE BREAKDOWN OF A ONE-PARTY-DOMINANT REGIME (1996).

[39] GABINETE DE COMERCIO EXTERIOR, *supra* note 18, 106.

Deputy Trade Minister Bravo Aguilera traveled to Geneva shortly before the presidential announcement and met with GATT Director-General Arthur Dunkel. Bravo carried a letter signed by De la Madrid, expressing Mexico's interest in starting negotiations for GATT accession. At this point in time Mexico's Ambassador for Multilateral Organizations, Manuel Tello, had not been informed of the decision. Dunkel looked upon the Mexican proposal very favorably. The GATT was in a political crisis of sorts, and there had been no consensus to start a new round of trade negotiations. He thought that Mexico's proposal might help breathe some life into GATT and help launch a new round.

On November 27 Bravo Aguilera participated in a meeting of the GATT Contracting Parties to announce Mexico's decision to initiate accession negotiations. A working group composed of Argentina, Australia, Austria, Brazil, Canada, Chile, Colombia, Cuba, the EC and its Member States, Korea, Finland, Hong Kong, Hungary, India, Jamaica, Malaysia, Norway, New Zealand, Peru, Sweden, the United States, Uruguay and Yugoslavia, chaired by Mr. George Reisch from Austria, was established. Eight meetings were held, with representatives of the Mexican business sector attending only the last one.[40]

Mexico approached the EC representative and obtained an agreement whereby it would approve Mexico's accession without further ado, automatically acquiescing to MFN treatment under the conditions negotiated by the United States. In essence, the accession negotiations became a bilateral matter between Mexico and the United States

Negotiations with the United States took place in Zihuatanejo, a beach resort on the Mexican Pacific coast. Mexico's first proposal was for the United States to accept the 1979 Protocol, but it rejected the proposal, saying that Mexico had lost its chance when it balked at the last minute, and now it had to negotiate a new and standard protocol. Mexico acquiesced, but asked to include several additional paragraphs in an otherwise standard protocol, covering concerns in areas such as oil, agriculture, industrial programs and development policies.

A negotiation strategy that proved successful was to present the representative of the Agriculture Ministry, Carlos Vidali, as the absolute hardliner within the Mexican team. When the U.S. delegation did not accept certain proposals, Vidali would say that it was exactly what he wanted, for under those conditions Mexico could not join GATT and the Agriculture Ministry was against accession in the first place. With that strategy, the text slowly came into its own in accordance with the basic concerns of Mexico.[41]

After negotiations with the United States concluded, the head of the Mexico delegation met with the EC delegation, but a member of the European delegation attempted to back off from the initial offer, arguing that the EC thought the United States would be a tough negotiator and saying that Mexico got an extremely favorable Protocol of Accession. He even hinted at the need for a secret memorandum involving energy cooperation if it was to get EC support for accession. Mexico steadfastly rejected the proposal and there never was any secret memorandum.

The EC still insisted on some concessions, and Mexico awarded them in several products, such as asparagus. This was a politically-oriented exercise to enable the EC

[40] *Id.* at 11.

[41] Bravo Aguilera, *supra* note 16.

to say that it had obtained something from Mexico, rather than an agreement with far-reaching economic consequences.

As had been the case in 1979, the 1986 Protocol fulfilled basic Mexican requirements. The Presidential conditions were covered in three paragraphs that were appended to the standard accession protocol; a substantial amount of legislation was grandfathered and special provisions were obtained for the automotive, pharmaceutical, and agricultural sectors. Mexico successfully negotiated a fifty percent bound tariff level, higher than the rates it was currently applying, and an eight-year phase-in period during which tariffs could be higher than the bound level for certain products.[42]

It is not widely known that Chile attempted to obstruct Mexico's accession to GATT. The reason was not economic but political, insofar as Mexico had supported the Allende regime and received many political exiles during the Pinochet dictatorship. Mexico turned to the Asociacion Latinoamericana de Integracion ("ALADI"), arguing that trade negotiations among ALADI members should take place in that forum and not in GATT. Chile backed off after the matter was discussed in ALADI.

Another Latin American country that did not support Mexico's accession was Brazil. It looked askance at Mexico being invited to the Green Room and thought that it would have to face competition from another large Latin American country. The excuse for not voting in favor of Mexico's accession was that Itamaraty (the Brazilian Foreign Ministry) was studying the matter and had not sent the necessary reports to its representative in GATT.

Argentina was of two minds regarding Mexico's accession. One deputy foreign minister was pro-Brazilian and did not see accession in a favorable light. Another deputy minister thought that Argentina should not ally itself exclusively with Brazil and argued that closer relations with Mexico were favorable for a diversification of economic and political relations. In the end Argentina voted in favor of Mexico's accession.

The Protocol was signed on July 12, 1986 and approved on July 17 with 63 votes in favor of Mexico's accession. The formal accession took place on August 24, and Mexico became the GATT's 92nd Contracting Party.

The decision to join the GATT had been made at last. When Mexico finally became a Contracting Party, the decision turned out to be "much ado about nothing": the Protocol allowed ample room of maneuver on all areas of economic policy, and the most far-reaching trade policy reforms were ultimately carried out unilaterally and through regional commitments.

III. Mexico in the Uruguay Round

The aggressive unilateral trade liberalization and several regional integration agreements signed during the lengthy road to GATT membership made Mexico's position in the Uruguay Round ("UR") different from that of other developing countries. It was at the forefront in some areas such as investment and intellectual property rights, and gradually softened its position on agriculture, acquiescing to the elimination of export subsidies and the full tariffication and binding of agricultural imports.[43]

Mexico gained improved access for some of its exports while not having to make significant concessions in return, given the large margin that prevailed between its bound

[42] Gabinete de Comercio Exterior, *supra* note 18, 11–23.

[43] Mexico's willingness to eliminate export subsidies may have been partly due to the scarcity of public resources for export subsidies rather than a policy switch on principle.

rate and applied rate levels. In addition, by the end of the Round, most of Mexico's trade legislation was already in compliance with its UR commitments, due to changes in domestic legislation implemented as a result of, or concomitantly with, its NAFTA commitments.[44]

The economic impact of its UR commitments was very limited, as was the legal impact. This was largely due to the fact that NAFTA went into effect on January 1, 1994, and most of the increase in trade flows from that date to the present involved bilateral trade with the United States. Mexico's exports increased from US$60.9 bn. in 1994 to US$166.4 bn. in 2000, by which date 89 percent were destined for the United States.[45]
Mexico's Uruguay Round commitments are described below.[46]

A. Market Access: Tariffs

1. Industrial Goods

Bound tariffs were reduced from fifty percent to 35 percent in a five-year transition period. Mexico's bound tariffs remain higher than many of its applied rates. The differentials between bound and applied rates were considered undesirable and a source of uncertainty by some of Mexico's trade partners.[47] The significant increase in tariffs implemented after the December 1994 peso devaluation shows that their concerns were not groundless.

Mexico proposed that the WTO grant recognition for unilateral tariff reductions, thus providing incentives to decrease the bound rates to the applied rates.

Mexico gained improved access for its exports of beer, rum, tequila, pharmaceuticals, chemicals, furniture, glass, ceramics, some steel products, combustion engines and their parts, computers and vehicle chassis. It received substantial tariff reductions from several countries, with reductions of over forty percent (in terms of weighted tariff averages) from Australia, Austria, the European Union, Japan and New Zealand.[48]

2. Agriculture

As of January 1, 1994, Mexico implemented the tariffication of non-tariff barriers on various agricultural products, including those in sensitive sectors such as maize, beans and dairy products, for its NAFTA partners. It tariffied import licences on an MFN basis as a result of its Uruguay Round commitments. Mexico expressed disappointment in that export subsidies were still allowed under the Uruguay Round Agreement on Agriculture.[49] It proposed, as a second-best solution, that developing countries be allowed to match other countries' subsidies in order to defend certain products in third markets.

The main agricultural exports of Mexico that benefited from Uruguay Round tariff reductions are honey, fresh flowers, avocados, mangos, lemons, coffee, orange juice, oranges, papayas, onions and cantaloupes.[50]

[44] Under Article 133 of the Mexican Constitution, international agreements subscribed by the President and ratified by the Senate have the highest legal status and require no implementing legislation. *See* World Trade Organization, Examen de las Políticas Comerciales: México 1997 WT/TPR/S/29 (1998).

[46] Unless otherwise noted, the source is Antonio Ortiz Mena L.N., *Mexico and the WTO: A Regional Player in Multilateral Trade Negotiations*, CIDE Working Paper EI-74 (2001).

[47] World Trade Organization, *supra* note 44.

[48] SECOFI, Ronda Uruguay del GATT: Resultados Globales e Implicaciones Para México, unpublished manuscript.

[49] OECD, *supra* note 31, 85.

[50] SECOFI, *supra* note 48.

Regarding price supports, Mexico, along with the other developing countries, agreed to a 13.3 percent reduction in the Total Aggregate Measure of Support.[51] Subsidies for basic foodstuffs (maize, beans and milk) were reduced, and subsidies for tortillas were eliminated in 1999.

As a result of tariffication commitments, tariffs imposed on agricultural imports will decline from an import-weighted base level of 77 percent to an eventual bound level of 67 percent over a ten-year transition period.[52]

Mexico proposed that certain subsidies for environmental protection not be subject to countervailing duties, and the proposal was endorsed during the UR. These subsidies fall within the "Green Box" exception under paragraph 12 of Annex 2 to the Agreement on Agriculture. Even though Mexico did not grant any export subsidies by the end of the Uruguay Round, it reported them for the base period of 1986–1990, at which time it did grant some export subsidies, which was the period used in the Round as the basis for reductions. The products covered were maize, beans, wheat, sorghum and sugar, in order for Mexico to be able to utilize export subsidies for those products, should the need and ability arise.[53]

3. Textiles and Apparel

The textile and apparel sector is extremely important for the Mexican economy in terms of employment. Even though Multi-Fiber Arrangement quotas will be phased out, high tariffs will continue to hinder exports from developing into developed country markets.[54] Although Mexico secured access to the U.S. market for originating goods under NAFTA rules, it will still face high tariffs for non-originating goods, which are significant given NAFTA's extremely restrictive rules of origin for textiles and apparel.[55]

B. Market Access: Non-Tariff Barriers

1. Safeguards

Mexico rarely makes use of safeguards, nor has it been unduly concerned with the use of safeguards by its trade partners. During the Round it supported the stricter disciplines imposed by the UR Safeguards Agreement.

2. Antidumping and Countervailing Duties

Mexico favored stricter disciplines than those ultimately accepted in the UR Agreements, and was among the proponents of substituting competition policy for unfair trade laws. Its antidumping legislation is basically in accord with the UR Agreement.

[51] The Total Aggregate Measure of Support or Total AMS is "the sum of all domestic support measures provided in favour of agricultural producers which are deemed to be more than minimally production and trade distorting (OECD, supra note 31, 89). In the case of Mexico, this translates into a reduction from $29 to $24 billion pesos from 1995 until 2004.

[52] OECD, *supra* note 31, Table 24.

[53] The likelihood of Mexico actually using these export subsidies is remote, given current (and foreseeable) tight budgetary constraints, and the fact that Mexico is actually a net importer of all these products except sugar.

[54] Jeffrey J. Schott and Johanna W. Buurman, The Uruguay Round: An Assessment 59 (1994).

[55] Gary Clyde Hufbauer and Jeffrey J. Schott, NAFTA: An Assessment (Revised Edition) 44 (1993).

3. Subsidies

Mexico's preferences on non-agricultural subsidies were reflected in the SCM Agreement. It requested non-actionable status for certain environmentally-related subsidies, and for regional subsidies aimed at decentralizing production away from large urban centers.[56] It also proposed that countries be given credit for eliminating their export subsidies ahead of the timetable agreed to in the UR.

4. Balance of Payments Exceptions

Since 1982 Mexico has tended to respond to balance of payments imbalances through macroeconomic adjustment rather than via trade restrictions. Given past practice, and the current 35 percent bound tariff level under the WTO, it is not concerned about the Uruguay Round Agreements in this matter or interested in joining the crusade of India and other developing countries against any restrictions on the application of GATT 1994 Article XVIII:B.

5. Technical Barriers to Trade

Mexico was a signatory to the Tokyo Round Agreement on Technical Barriers to Trade,[57] and during the UR supported the position that the Agreement only cover production and processing methods.

6. Sanitary and Phytosanitary Measures

The Mexican regime is largely the result of NAFTA commitments and its practices are similar to those agreed to in the UR.

7. Rules of Origin

Mexico does not apply specific rules of origin to imports from MFN sources; however, it does require certificates of origin when those goods are subject to anti-dumping or countervailing duty actions, especially in certain sectors, such as textiles, apparel and shoes.

8. Import Licenses

Mexico has virtually eliminated its use of import licenses and its practices formally comply with the GATT Import Licensing Code. Nevertheless, some delegations to the WTO have questioned the transparency in the award procedures for import licenses, especially when the fulfillment of compulsory standards is required.[58]

C. State-Trading Enterprises

The state-trading enterprise that raised greatest concerns for foreign exporters was the one dealing with subsidized staple products ("CONASUPO"), because it had a monopoly over powdered milk imports, and the majority of import permits for maize and beans were also given to that state enterprise. In the late 1990s several countries complained

[56] The UR Agreement on Subsidies and Countervailing Measures exempted certain R&D activities, regional assistance, and the adaptation of existing plants to new environmental requirements. However, the exemption has lapsed. *See* Chapter 16 of this book. In contrast, actionable subsidies are those for which the imposition of countervailing duties is legitimate, in the case of subsidies that have certain specified adverse effects; export subsidies are prohibited outright. (SCHOTT AND BUURMAN, *supra* note 54, 88–91).

[57] Mexico ratified the Standards Code on February 9, 1988 and notice was published in Mexico's Federal Register on April 20, 1988.

[58] WORLD TRADE ORGANIZATION, *supra* note 44, at 227.

about the lack of transparency in many dealings of CONASUPO, and of the Mexican government's reluctance to give full and clear information of its practices.[59] CONASUPO has since been dismantled, although its affiliate in charge of milk, LICONSA, is still in operation.

D. Trade-Related Investment Measures

Local content requirements are still prevalent in the auto sector. The aim of Mexican policy is to generate incentives for the use of local auto parts. In the case of small vehicles, the local content requirement is thirty-six percent, and for large vehicles forty percent. While these measures are inconsistent with the UR Agreement on Trade-Related Investment Measures, Mexico, like other developing countries, was allowed to retain them for five years after the entry into force of the UR Agreement.[60] Mexico subsequently obtained an extension until the beginning of 2004. Some countries have made known their opposition to restrictive practices by Mexico in the auto sector.[61]

E. Trade-Related Intellectual Property Rights

Mexico's intellectual property regime was strengthened during the time of the NAFTA negotiations and in theory is close to being state of the art. In terms of exports, Mexico is interested in securing name protection for region-specific products such as *mezcal* and *tequila*.[62]

F. Trade in Services

Mexico made commitments in most areas covered by the negotiations except for environmental services and recreational, cultural and sporting services. Its commitment on the movement of physical persons is limited to intra-corporate transfers and specialists. It maintained limitations on foreign ownership in a number of sectors, among them the financial sector. The cap on foreign ownership of commercial banks was raised by ten percentage points to thirty percent as a result of the GATS negotiations, but that cap has since been lifted.

Foreign investment was limited to 49 percent of the registered capital in accounting, auditing and bookkeeping, certain telecommunications and audiovisual services, construction, private education and health services. Certain professional services and all scheduled distribution services were fully liberalized in terms of caps on foreign ownership.

One of the most contentious issues in Mexico's current trade relations involves its multilateral commitments to liberalize trade in telecommunications services. Mexico was one of the 68 countries that subscribed to the WTO Basic Telecommunications Agreement, which came into force in February 1998, and it also adopted the Reference Paper on Regulatory Principles in all aspects except resale. In July 2000,

[59] *Id.* at 230.

[60] The Uruguay Round Agreements entered into force on January 1, 1995.

[61] WORLD TRADE ORGANIZATION, *supra* note 44, 229.

[62] The only major complaint against Mexico related to this area was a Swiss concern that the new Health Law facilitates imports of pharmaceuticals but at the same time certain regulations generate incentives for the prescription of generic as opposed to brand name drugs, which according to the Swiss is a discriminatory practice against name brands (WORLD TRADE ORGANIZATION, *supra* note 44, 232).

the Office of the United States Trade Representative requested WTO consultations with Mexico regarding alleged barriers to competition. It expressed concern on three issues:

> Lack of effective disciplines over the former monopoly, Telmex, which is able to use its dominant position in the market to thwart competition; failure to ensure timely, cost-oriented interconnection that would permit competing carriers to connect to Telmex customers to provide local, long-distance, and international service; and finally, failure to permit alternatives to an outmoded system of charging U.S. carriers above-cost rates for completing international calls into Mexico.[63]

G. Government Procurement

Mexico did not sign the plurilateral WTO Government Procurement Agreement, and several countries have complained about the apparent unwillingness of Mexico to liberalize this sector.[64]

H. Regional Trade Agreements

As a signatory to several free trade agreements. Mexico is very sensitive about any changes to Article XXIV of GATT 1994. During the UR it argued, together with the European Free Trade Association and the European Union, against the Australian position of requiring that no major sector be excluded from a preferential trade agreement. In the end, the Understanding on Article XXIV made no reference to the need to include all sectors in WTO consistent regional trade agreements.[65]

I. Dispute Settlement

Regarding dispute settlement, Mexico accepted the time limits and the requirement of unanimity to reject the adoption of panel reports, but supported differential treatment for developing countries on certain procedural issues.

IV. Mexico and the Dispute Resolution Process in the GATT/WTO

Mexico regards effective dispute settlement mechanisms as an essential element of the institutionalization of international economic relations and the basis of a rule-oriented system where power disparities are not abused. When President de la Madrid instructed his trade minister to start GATT accession negotiations, one of the reasons used to justify accession was the importance of the GATT's dispute settlement mechanism as a means of defending Mexico's commercial interests and of curtailing the application of unilateral measures by its trade partners.[66]

Mexico's participation in dispute settlement during its first few years of GATT membership was very limited. From its accession in 1986 to 1992, it made only three claims, all of them against the United States, and was not the defendant in any case. Brazil did

[63] USTR, Press Release 00–57 (July 28, 2000). The case is styled *Mexico—Measures Affecting Telecommunications Services*, WT/DS204.

[64] World Trade Organization, *supra* note 44, 232.

[65] Mexico wanted to be able to exclude the oil sector from any regional trade agreements, while EFTA and the EU wanted to retain ample protection for their agricultural sector.

[66] Gabinete de Comercio Exterior, *supra* note 18, 105.

request the initiation of consultations on an anti-dumping matter involving Brazilian textiles, but the matter was resolved at that stage.[67]

Mexico's first claim involved U.S. duties on oil exports and on oil derivatives, in which it was joined by Canada and the EC. The Panel report upheld the complaint with respect to the duties on oil, but rejected it regarding duties on oil derivatives.[68]

The second claim involved U.S. restrictions against Mexican tuna exports, on the basis of the provisions of the U.S. Marine Mammal Protection Act for the protection of dolphins. The Panel report was in Mexico's favor,[69] but both countries agreed not to adopt the report. Mexico's decision was based on the fact that it was negotiating NAFTA at the time, and did not want an adverse reaction by environmental groups.

The third claim involved U.S. anti-dumping duties on imports of cement from Mexico. The Panel held in Mexico's favor,[70] but adoption of the report was blocked by the United States.

Mexico has been more active in the GATT/WTO dispute settlement since 1993, and it has been the subject of claims as well as the source of them.[71] It requested consultations on more than fifty matters regarding sanitary and phytosanitary measures, technical barriers to trade, subsidies and AD/CVD measures.

Between 1995 to October 2002, Mexico was the defendant in seven cases, of which it won three, lost one, and three were pending at the time of writing (late 2002).[72] Most cases involved antidumping practices, technical barriers to trade, and alleged anticompetitive practices. Not surprisingly, because of the huge volume of trade between the two countries, the most intractable issues have been with the United States, as was the case between 1987 and 1992. Two issues stand out: Mexican anti-dumping actions against U.S. exports of high fructose corn syrup, and Mexican measures affecting the provision of telecommunications services.

Despite its increasing participation in WTO dispute settlement, Mexico still resolves most of its disputes through the dispute settlement mechanisms contained in its free trade agreements. The majority of its disputes are with its main trade partner, the United States, and they are mostly addressed *via* NAFTA dispute settlement mechanisms.[73]

Overall, Mexico's experience with WTO dispute settlement has been satisfactory. In terms of improvements it believes that the different stages of the process can and should be expedited and that stricter guidelines are required in that regard. It will also propose a clarification of Articles 21 and 22 of the Dispute Settlement Understanding, to eliminate any possibility of a Member engaging in retaliatory actions without the express approval of the Dispute Settlement Body.

[71] The information for the 1993–1997 period is taken from World Trade Organization, *supra* note 44, 191–192.

[72] World Trade Organization, Trade Policy Review: Mexico Report by the Secretariat WT/TPR/S/97, Table II.2 19–21 (2002).

[73] For an analysis of Mexico's use of NAFTA versus WTO dispute settlement, see Linda C. Reif, *NAFTA, the WTO and the FTAA: Choice of Forum in Dispute Resolution*, in NAFTA in the New Millennium (Edward J. Chambers and Peter H. Smith eds. 2002). For an overview of Mexico's disputes in NAFTA see Antonio Ortiz Mena L.N., *Dispute Settlement Under NAFTA*, in NAFTA in the New Millennium. supra., and Antonio Ortiz Mena L.N., *La Solución de Controversias en el Tratado de Libre Comercio de América del Norte: Un Esbozo Sobre su Desempeño y Retos* (2002).

While recognizing the need for dispute settlement procedures to be as transparent as possible, Mexico is opposed to the submission of *amicus curiae* briefs and favors maintaining briefs at the strictly inter-governmental level.

During the Uruguay Round Mexico proposed that, where feasible, competition policy rules should be applied in lieu of anti-dumping measures, for many of the cases in which Mexico is involved, as both defendant and plaintiff, are related to anti-dumping issues. It has ceased to insist on the issue.

V. Mexico and the Doha Development Agenda[74]

Mexico participated in the Fourth WTO Ministerial Conference after an extremely successful decade in terms of trade policy aims and achievements. During that decade it entered a number of free trade agreements, foremost among them NAFTA, and capped them off with its 2000 Association Agreement with the European Union. In terms of trade volumes, exports grew from US$21.8 bn. in 1986, at the time of its GATT accession, to US$166.4 bn. in 2000, an impressive average annual increase of over fifteen percent.[75]

Mexico's overall aim is to contribute to a more open, fair and stable international trading system through the actions of the WTO, and at the same time to ensure that the very significant gains it has made through its FTAs are maintained. Mexico believes that the best way to achieve these objectives is to participate very actively in the WTO. Accordingly, in August 2000 Mexico hosted a preparatory meeting for the Fourth Ministerial Conference, attended by Argentina, Australia, Brazil, Canada, the EC, Egypt, Hong Kong, India, Jamaica, Japan, Malaysia, Pakistan, Singapore, South Africa, Switzerland, Tanzania, the United States and Uruguay. In October 2001 it coordinated the working group on agriculture during the informal meeting of trade ministers in Singapore, and it chaired the intellectual property working group during the Fourth Ministerial Conference. Mexico was due to host the Fifth Ministerial Conference in Cancun in September 2003.

In terms of launching a new multilateral trade negotiation round, Mexico favored a single undertaking given that, in its view, sectoral negotiations make compromise and side bargains difficult. Regarding timelines, Mexico expressed a preference for a negotiation round of approximately three years duration, and in any case no longer than the Uruguay Round. The Doha Agenda is thus in line with its preferences on these issues.

Regarding issue area coverage, it favored addressing the built-in agenda in the next round of negotiations, but regarded it as insufficient. It sought, at a minimum, full binding of the tariff structure for industrial goods. In terms of new issues, its position is that "contamination" of the trade agenda with environmental and labor issues could actually negate the gains made in trade liberalization;[76] likewise, it took the view that it will be difficult for developing countries to address issues such as trade and investment, trade and competition policy, transparency in government procurement, and trade facilitation brought up during the 1996 Singapore Ministerial Meeting.

[74] Unless otherwise noted, the sources for this Part are Ortiz Mena L.N., *supra* note 46, Secretaría de Economía, *México y la Quinta Conferencia Ministerial de la Organización Mundial del Comercio* (2001), unpublished manuscript, and Secretaría de Economía, *México y la Organización Mundial del Comercio* (July 2002), unpublished manuscript.

[75] Secretaría de Economía, *supra* note 74 (2002).

[76] SECOFI, Reunión Ministerial de Seattle y la Posibilidad de una Nueva Ronda de Negociaciones 23 (1999).

Its position regarding the four broad areas contemplated in the Fourth Ministerial Conference are as follows:

A. Implementation of UR Agreements

Mexico believes that the implementation of market access commitments in agriculture and textiles has not translated into improved access for developing country exports, that special and differential treatment for developing countries has not materialized in practice, and that legitimate implementation difficulties faced by developing countries should be recognized and allowed for. Mexico itself has benefited from the implementation of the UR Agreements by other countries, and has upheld its own commitments.[77]

B. Built-in Agenda

AD/CVD rules: Mexico favors rules that allow the legitimate use of AD measures and at the same time curtails their use for strictly protectionist aims.
Agriculture: A priority is the reduction and eventual elimination of export subsidies, and improved market access.
TRIMs: Mexico has to eliminate performance requirements in its automotive industry. It agreed, under NAFTA rules, to eliminate a number of provisions of the auto decree by 2004, but under the TRIMS Agreement it would have been forced to eliminate them by 2001, thus losing important concessions it gained in NAFTA. In July 2001 it requested an additional moratorium to bring its decrees into full compliance with the WTO TRIMs Agreement. An extension was granted, so that Mexico's auto sector decrees must comply with TRIMS by January 1, 2004.[78]
Services: As the most important exporter of services in Latin America, Mexico is interested in as wide a sectoral coverage as possible. It would gain from the negotiations by attaining greater market diversification. It also wants to ensure that there is flexibility for developing countries regarding trade in services negotiations.
IPR: Mexico seeks the establishment of a multilateral system of registry and notification of distinctive products, for wine and spirits. This interest pertains basically to *tequila* and *mezcal*, which are recognized as distinctive products under NAFTA Annex 313. However, it opposes the extensive use of geographical indications, which could constitute a new non-tariff barrier.

Regarding IPR and public health issues, Mexico believes a balance must be struck between the legitimate needs of developing countries and respect of the Trade-Related Aspects of Intellectual Property Rights Agreement. As Chair of the Fourth Ministerial working group on the issue, it believes that the correct balance was struck with the Doha Declaration on the topic.[79]

C. Singapore Issues

Mexico did not request negotiation on the four topics covered by the Singapore Ministerial, although it accepted the agreement to discuss them during the Fifth Ministerial. Its FTAs already cover these issues, so multilateral agreements will probably not imply any significant new commitments for Mexico.

[77] Secretaría de Economía, *supra* note 74 (2002).
[78] World Trade Organization, *supra* note 72, at 71.
[79] Secretaría de Economía, *supra* note 74 (2002).

Regarding foreign direct investment, Mexico takes the view that an eventual multilateral agreement on investment should not be linked with environmental and labor issues, nor inhibit the regulatory faculties of the state. As mentioned, it also wants to incorporate competition policy criteria in the application of anti-dumping laws. Mexico favors transparency in government procurement but has given no indication that it intends to sign on to the WTO Agreement on Government Procurement. Finally, Mexico has made some progress in areas such as customs procedures and is not opposed to their inclusion, but trade facilitation is not an area of paramount concern.

D. Other Issues

Industrial goods: Mexico favors full binding of the industrial goods tariff structure by all WTO Members. It is opposed to a sectoral approach, preferring the inclusion of all sectors so that a more balanced final deal is possible. It believes that a significant reduction and binding of the full tariff structure for industrial goods will improve its market access to countries with which it does not have an FTA.
Electronic commerce: Mexico takes the position that there should be no tariffs on electronic transmissions.
Labor and environmental issues: Mexico accepts the need for their discussion, but is opposed to formal commitments within the realm of the WTO that would result in disguised protectionism by developed countries. It believes that the proper instruments and venues must be used to deal with them, such as the International Labor Organization for trade-related labor issues. It also believes that trade and environmental protection are not mutually exclusive, and that greater economic growth can help protect the environment.[80]

VI. Regional Trade Agreements: NAFTA and Beyond

For Mexico, regional trade initiatives are at least as important as multilateral ones. Mexico now has free trade agreements ("FTAs") with thirty countries, and more than 95 percent of its trade is carried out with its FTA partners.

A. NAFTA

At the time of its accession to GATT, Mexico had several trade agreements with Latin American countries under the aegis of the Asociacion Latinoamerica de Integration ("ALADI"). None of them, however, was of any real economic significance. At the outset of his administration, President Carlos Salinas (1988–1994) tried to diversify Mexico's trade relations, long dependent on its northern neighbor, by attempting to forge closer economic links with the EU. With the fall of the Berlin wall in 1989 the circumstances were not propitious for that undertaking, since the EU was focusing its attention on developments in Eastern Europe, and so in mid-1990 President Salinas proposed the negotiation of a free trade agreement with the United States.

Bilateral negotiations became trilateral once Canada joined, a short time thereafter. The NAFTA was negotiated between 1991 and 1993, the so-called side agreements on labor and environmental cooperation were negotiated in 1993, and the agreement entered into force on January 1, 1994.

[80] *Id.*

The NAFTA was Mexico's first FTA (for a long time it was referred to simply as *the* FTA) and still is by far the most important one in terms of trade and investment volumes, accounting for more than 85 percent of Mexico's exports. Mexico is now the United States's second trade partner, surpassed only by Canada. Mexico-Canada trade, although growing, is insignificant in terms of each country's trade with the United States. NAFTA is, in effect, an agreement encompassing two very intense bilateral economic relations.

B. FTAs With Latin American Countries

Mexico embarked on an assertive policy to secure additional FTAs throughout the1990s. Negotiations started out with Latin American countries, and the concluded agreements are the following: Mexico-Bolivia (1995), Mexico-Costa Rica (1995), G-3 (Mexico-Colombia-Venezuela 1995), Mexico-Nicaragua (1998), Mexico-Chile (1999), and Mexico-Northern Triangle (El Salvador, Honduras and Guatemala 2001).[81]

The agreements are all closely patterned after the NAFTA in terms of the range of issues covered and their institutional structure. They include a broad array of topics, such as trade in goods (including agriculture), trade in services, and investment. They also contain detailed dispute settlement procedures.[82] However, Mexico's trade agreements with other Latin American countries do not contain detailed provisions on labor and the environment.

C. Europe

Apart from the Latin American FTAs, Mexico has entered three extra-hemispheric agreements. The most important of these is the Economic Partnership, Political Coordination, and Cooperation Agreement with the EU (sometimes referred to as the Global Agreement, the Association Agreement, or the Mexico-EU Free Trade Agreement). As its correct and formal name implies, it has three basic components: economic relations (commonly referred to as the Mexico-EU FTA), cooperation, and political dialogue. It is thus very different from NAFTA and the Latin American agreements, which follow a purely economic approach.

The EU Agreement, which entered into force on July 1, 2002, is complemented by an FTA with the European Free Trade Association (Iceland, Liechtenstein, Switzerland and Norway), which entered into force exactly one year after the EU Agreement. Mexico's long-held desire to have a more balanced trade pattern in terms of markets–that is, a reduction of its very strong reliance on the U.S. market–has been given an enormous boost with the privileged access it has gained to Europe, the largest market in the world.

D. Israel

The third extra-hemispheric agreement is an FTA with Israel, which entered into force on the same date as the EU agreement. It is the least ambitious of Mexico's FTAs and does not cover investment, agriculture, or trade in services.

[81] The year reported refers to the entry into force of these agreements.

[82] There are, of course, differences and exceptions. Some of these are noted in ORTIZ MENA L.N., *supra* note 46. An excellent summary of NAFTA's provisions is HUFBAUER AND SCHOTT, *supra* note 55.

E. APEC

Although not an FTA, it is worth noting that Mexico has been a member of APEC since 1993, and hosted the Fourteenth APEC Ministerial Meeting and the Tenth APEC Economic Leaders Meeting in 2002.

F. Current Negotiations

At the time of writing (late 2002), Mexico was negotiating FTAs with Ecuador, Japan, Panama, Peru, Singapore, and Trinidad and Tobago. It concluded an ambitious trade agreement under ALADI with Uruguay in 1999, and is gradually improving its trade relations with Brazil, which were neglected for a long time.[83] It is also participating in the Free Trade Area of the Americas ("FTAA") negotiations, whose secretariat was in Puebla, Mexico.

Mexico is, accordingly, extremely sensitive about developments in the multilateral trading system that might adversely affect its regional preferences. At the same time, it believes that regional and multilateral trade liberalization can be compatible, and that the best way to maintain its regional advantages is to be actively involved in the multilateral process.

VII. The Politics of Trade Policy-Making in Mexico

From the time of Mexico's first overtures to GATT in the post World War II era a single political party, the Institutional Revolutionary Party ("PRI"), controlled the presidency until 2000, and had at least a simple majority in the legislature until 1997. Under the prevailing political system, which relied on strong control of the party and the legislature by the chief executive and was supported by a corporatist mode of interest representation (including not only labor but also business), the chief executive had ample discretion to pursue economic policies, including trade policy.[84] The high degree of power concentrated on an individual often proved disastrous in terms of economic policy, as the 1976 and 1982 crises demonstrate.

During most of the import-substituting industrialization phase, there was close coordination between the public and private sector, both through established institutional channels and through close rapport between political and economic elites.[85] The system began to show signs of strain in the late 1960s, but it was during the Echeverria administration that an open confrontation between the government and business groups took place. During that time, economic policy, including trade policy, was often decided by the president and implemented with relative ease through his control over congress and the PRI.[86]

Lopez Portillo campaigned for the presidency in 1976 without an opponent, for important business groups usually tied to the right-of-center National Action Party ("PAN") boycotted the election as a response to what they regarded as Echeverria's anti-business policies of 1975–1976.[87] Despite the difficult economic and political circumstances, Lopez Portillo managed to regain the favor of the country's economic elite and major business groups. Significant economic policy decisions, such as the

[87] These included, apart from irresponsible macroeconomic management, a series of land expropriations.

postponement of GATT accession were, however, ultimately decided with little influence from business groups.

The same situation prevailed during the De la Madrid presidency. The Senate hearings on GATT accession proved to be a mere formality designed to underpin a decision already taken by the chief executive. Business representatives participated in GATT accession negotiations only during their last phase. Likewise, the government proceeded with unilateral liberalization that went beyond its GATT commitments, despite previous agreements with business groups.[88]

After accession to GATT a novel consultative mechanism came into being. In order to implement a new stabilization program aimed at reducing inflation, which approached 160 percent in 1987, a tripartite consultation mechanism consisting of representatives from government, labor, and business was established. The mechanism was the centerpiece of the Economic Solidarity Pact, a major component of which was further trade liberalization with the aim of reducing inflation through greater competition from imports on traded goods.[89]

However, the real sea change in the trade policy formulation process came with NAFTA. An innovative scheme worked out by government and business representatives permitted an extremely close collaboration between them before, during, and after negotiations. The change was a result of the needs imposed by the sheer complexity of the negotiations, and of the significant impact their results would have on the Mexican economy for decades to come.

The mechanism set up for NAFTA negotiations was used in all subsequent trade negotiations and has survived, with some modifications, up to the present. It consisted of two basic channels of communication for interest groups. The Foreign Trade Business Coordination Council ("COECE") is an umbrella organization encompassing all major business organizations.[90] The other channel is the Free Trade Agreement Advisory Council (*Consejo Asesor del Tratado de Libre Comercio*), designed to represent civil society and comprised of representatives from the public sector (top officials from the Trade Ministry), the labor sector (basically members of pro-government labor unions), the agricultural sector (both PRI-affiliated groupings and private sector groupings representing agribusiness and livestock interests), the business sector, and the academic sector (heads of the nation's top public and private universities). The Council is charged with preparing, coordinating and analyzing reports to aid the negotiations.[91] In practice, the Council was rather passive during NAFTA negotiations but did fulfill a legitimating function in terms of the representativeness of the groups privy to the negotiations; it helped the government receive input from different social groups, and also to distribute information and rally support for the trade negotiations.[92]

COECE was by far the most important of the communication channels during NAFTA and all subsequent trade negotiations. It was divided into six sectors: agriculture, industry, banking, insurance, finance, and commercial and non-financial services. It coordinated a series of highly confidential studies, which were used to help determine negotiating positions. Representatives from COECE formed small groups (4–15 members) to work in tandem with the negotiators in each of the areas into which negotiations were divided, i.e., rules of origin, market access, agriculture, automotive sector, textile sector, energy, procurement, safeguards, unfair trade practices, norms, sanitary and phytosanitary issues, cross-border trade in services, telecommunications, financial services, land transportation, temporary mobility of business persons, investment, intellectual property rights and dispute settlement. These groups were involved in the day-to-day negotiations. They were in close contact with the negotiators throughout the process, and during negotiations participated via the "adjacent room" mechanism (*cuarto de al lado*), whereby they would be close at hand in the negotiating venue so that negotiators could get immediate feedback from the relevant private sector representative. COECE representatives also collaborated with the government during the post-negotiation phase involving implementing legislation in the United States, to ensure that the legislation did not cut back any of the rights granted to Mexico under the agreement. The closeness of collaboration between COECE and the NAFTA negotiators can hardly be overstated; hundreds of meetings had taken place by the time NAFTA entered into force.[93] The system worked remarkably well insofar as it permitted the successful negotiation of a very ambitious and complex FTA between a developing country and the world's foremost economic power.

Nonetheless, several important social groups did not have adequate representation. Although COECE formally ensured wide representation of business interests, in practice this was not always the case. Three limitations stand out: some sectors did not have the human and financial resources needed to undertake detailed studies of their sectors and to propose detailed negotiation objectives; financial limitations also meant that not all representatives could travel in tandem with the negotiators throughout North America during the course of negotiations; and third, small and medium enterprises (SMEs) were not well represented in the process.[94] The last shortcoming stemmed partly from the fact that there was no truly representative organization that could speak on behalf of SMEs, and this difficulty has remained to this day.[95]

Other groups without adequate representation were those that should have had a voice in the Advisory Council. No groups critical of trade liberalization policies were admitted, although it is fair to say that if critical non-governmental organizations are to be admitted, it is not immediately clear how to choose them objectively in terms of representativeness and legitimacy.

At present, the system still works very well in terms of business-government consultations on trade policy, but effective representation of SMEs and a more pluralistic representation of civil society are still lacking.

The Ministry of the Economy (called the Ministry of Trade and Industrial Development until 2001) is still in charge of trade policy, although long-standing intermittent frictions between the Ministry of the Economy and the Foreign Ministry over foreign economic

[93] Alba and Vega, *supra* note 92.

[94] *Id.*

[95] Business groupings were organized on the basis of sector, and not size. The Economics Ministry now has a deputy minister in charge of SMEs.

policy still come to the fore from time to time.[96] A long-standing inter-ministerial commission on trade policy, currently called COCEX, carries out intra-executive coordination.[97]

A challenge that is emerging for trade policy formulation is the role of the legislature, which is becoming increasingly active and assertive in the foreign policy area.[98] With a growing number of actors interested in—and affected by—trade policy, new mechanisms that find an adequate balance between representativeness and efficient policymaking must be designed and implemented.

VIII. Public Attitudes Toward the WTO

In Mexico, public opinion on trade policy matters tends to go in tandem with trade flows. Accordingly, the most salient concern by far is the economic relationship with the United States. Other developments, such as multilateral trade relations and even hemispheric ones, are usually regarded as being of relatively little consequence.

The exception to this general trend was the discussion on Mexico's accession to GATT in 1979–1980, but in fact this was a reflection of domestic political cleavages over economic development strategies; the GATT debates were merely a sounding board for a broader discussion closely linked to domestic politics. Notwithstanding the above, some opinions of business and civil society groups on multilateral trade developments can be ascertained.[99]

A. Opinions of Business Groups

In 2000, business representatives from five sectors (electric and electronics, automobiles, capital goods, textiles and apparel, and foodstuffs), accounting for approximately three quarters of Mexico's trade, had the following opinions on the Uruguay Round results and their relationship with the government on trade policy issues.

The *electric and electronics* sector regards the Uruguay Round as positive, for the Mexican government decided at the time not to join the Ministerial Declaration on Trade in Information Technology Products, which was in line with the preferences of its representative association, CANIETI, the National Chamber of the Electronics, Telecommunications and Computer Industries.[100] The *automobile* sector considers the results of the Round as positive because it had been possible to sidestep full compliance with TRIMs through a series of bilateral deals.[101]

[96] Jorge Schiavon and Antonio Ortiz Mena L.N., *Apertura Comercial y Reforma Institucional en México (1988–2000): Un Análisis Comparado del TLCAN y el TLCUE*, 41 FORO INTERNACIONAL (2001).

[97] WORLD TRADE ORGANIZATION, *supra* note 72, at 12. The COCEX is comprised of the following ministries: Foreign Relations, Finance, Social Development, Economy, Agriculture, Environment and Health. The central bank (*Banco de México*) and the Federal Competition Commission are also represented.

[98] The Senate has the authority to ratify treaties negotiated by the executive, while the Chamber of Deputies has an influence on trade policy through its faculties on fiscal policy, given that tariffs are considered an integral part thereof.

[99] The information on business groups and civil society opinions was obtained by the author through interviews carried out in 2000. The opinions are indicative of the concerns of some business and civil society leaders, and are not necessarily representative. A full account of the interviews is available in Antonio Ortiz Mena L.N., *supra* note 46.

[100] CANIETI, www.canieti.com.mx. In mid-2000 the members of CANIETI finally agreed to support Mexico's joining the ITA.

[101] As mentioned in a previous section, Mexico has to comply with the TRIMs Agreement by January 1, 2004.

The *capital goods* sector considers the Uruguay Round as irrelevant. The view of CANAME,[102] the National Chamber of Electric Manufactures which represents a sizable share of the capital goods sector, is that, since the largest share of trade in the sector is with the United States, most of the relevant liberalization was agreed upon on a regional basis. Its only concern is procurement, and specifically that the Mexican government can decide procurement rules on a unilateral basis for countries with which it does not have an FTA, and has accepted bids from countries that have a closed procurement market for Mexican corporations.

The *textiles and apparel* sector, represented by a specialized office in CONCAMIN, the National Confederation of Industrial Chambers, focused on NAFTA gains, which were considered very good for Mexico in the textile sector.[103] While the phasing out of the MFA was seen as inevitable, the major concern was a possible flood of garments from China into the Mexican market, once it joined the WTO.[104]

The representative of CANACINTRA, the National Industrial Transformation Chamber, a CONCAMIN affiliate, expressed opinions on the *agricultural* sector in general. Like his counterpart from the capital goods sector, the view was that the Uruguay Round Agreements were largely irrelevant for Mexico given the intensity of trade with the United States and the depth of commitments under NAFTA. The assessment of the NAFTA negotiations was extremely critical. The main concerns were alleged dumping practices by U.S. companies in exports of beef and pork meat, the difficulty of access to the U.S. market for Mexican sugar exports,[105] and the breakup of national production chains which has translated into a concentration of producers and retailers. A proposed solution is that many measures that do not require subsidies or other WTO infringing practices should be put in place, foremost among them more investment in R&D, closer working partnerships between universities and business, greater emphasis on the training of mid-level technicians, and a more proactive policy toward SMEs.

All representatives regarded the FTAA with little concern and were sanguine about the prospects of achieving a far-reaching hemispheric FTA.

The general opinion was that government-business relations regarding trade policy were collaborative, and that there was expertise in the government team in charge of trade policy and ample opportunity to be heard.[106] The great majority of concerns expressed are linked to issues that fall within the competence of the Mexican government and do not involve any third parties or the WTO. It seems that if there are good relations, open channels of communication and capable negotiators, the remaining problems have to be dealt with at the domestic political level.

B. SMEs and NGOs

The most vociferous criticism of Mexico's trade policies comes from NGOs rather than business groups. The Mexican Trade Action Network ("RMALC"),[107] established in

[102] CANAME, www.caname.com.mx.

[103] An additional interview with the businessperson responsible for NAFTA textile negotiations was also conducted.

[104] Mexico was the last Contracting Party to approve China's accession to the WTO.

[105] In August 2000 Mexico requested the establishment of a panel under NAFTA Chapter XX rules to settle the dispute over U.S. sugar quotas.

[106] CANIETI did express some concerns over lack of direct communication with negotiators.

[107] RMALC is the acronym in Spanish for the Mexican Trade Action Network, the *Red Mexicana de Acción Frente al Libre Comercio*. Its web site is www.rmalc.org.mx.

1991 at the outset of the NAFTA negotiations, functions as an "umbrella" organization representing the interests of a diverse array of groups involved in different issues such as human rights, labor rights, democracy, the environment and SMEs. RMALC questions the efficiency of the market mechanism in allocating resources and proposes a greater role for the state in ensuring an equitable allocation. It seeks greater participation of civil society in trade policy formulation and implementation, to ensure that it favors sustainable development and better living conditions for Mexicans. This requires, in their view, the establishment of national development programs and the incorporation of a social and political agenda in trade agreements that favor human rights and democracy, and compensate for asymmetries that prevail both within and among nations.

RMALC's proposals include sweeping changes to central elements of trade agreements, such as reinforcing special and differential treatment while relegating national and MFN treatment to relations among developed countries, and substantially modifying investor-state dispute settlement procedures. It also has specific concerns over IPRs in connection with public health issues. So far, its impact on Mexico's trade policy has been minimal, in no small measure as a result of some of its extreme positions, which makes dialogue and negotiation extremely difficult.

ANIT, the National Association of the Transformation Industry, is a breakaway group of CANACINTRA established at the time of Mexico's GATT accession. It is a RMALC member and represents the interests of some 3,000 SMEs. ANIT seeks a share in the procurement market, financing at competitive rates without burdensome guarantee requirements, and a greater say in trade policy formulation. Its partnership with groups within RMALC holding extreme positions has made it difficult for its voice to be heard. As was the case for the opinions of the business groups, most of ANIT's concerns can be answered at the domestic political level rather than through government actions at the multilateral level.

More recently, NGO discussions over economic development strategies have tended to be quite emotional and of very low analytic content. The WTO is sometimes brought up in these discussions without specific references to the Uruguay Round Agreements or the Doha Development Agenda, and is seen as an archetype of organizations that, like the IMF and the World Bank, are supposedly behind the advance of globalization, which is in turn blamed for a vast array of complaints such as low economic growth, environmental degradation, poverty and unequal income distribution. The government, pro free-trade groups and institutions undertaking serious academic studies of trade policy and development have an uphill battle in explaining how the multilateral trading system is not necessarily the cause of these shortcomings and can be part of their solution.

IX. Conclusions

Mexico's entry into the GATT, and its subsequent participation in the WTO, did not have a significant impact on trade composition or volumes, nor on market diversification. Unilateral liberalization and regional initiatives, foremost among them NAFTA, were the main forces behind changes in Mexico's trade regime and performance. The long-delayed decision to join the GATT seems indeed to have been "much ado about nothing."

The country has undergone a significant transformation since the early 1980s. Shortly before it joined the GATT in 1986, it still had a relatively closed economy with low export volumes and a high degree of dependence on oil exports. It managed to diversify its export structure in a very short time span, so that by the end of the 1980s oil accounted for less

than 25 percent of exports, and non-oil exports were mostly made up of manufactures.[108] The change in the composition of exports was associated with the downward evolution of oil prices and an increase in exports to the United States favored by a weak Mexican peso, rather than the effect of GATT membership.

During the 1990s, the most significant evolution in Mexican trade policy was the entry into force of NAFTA and several other FTAs. In terms of export composition there were no significant changes, but export volumes took off dramatically, growing from US$40.7 bn. in 1990 to US$166.4 bn. in 1999. The growth in exports was closely linked to bilateral trade with the United States, whose economy performed extremely well during the second half of the decade. While by 2000, 89 percent of Mexico's exports were destined for its Northern neighbor's market, Mexico's trade with the EU decreased from 11.4 percent of total trade in 1990 to 6.5 percent in 1999.[109]

The WTO is, however, becoming increasingly relevant as its scope and coverage increases and it encompasses issues that were only dealt with at the regional level, such as agriculture and services. The strengthened dispute settlement mechanism in force since 1995 has also made the WTO especially salient in terms of international economic governance.[110] Given that Mexico's FTAs are of a basically static nature in terms of scope and coverage and institutional makeup, while the multilateral trading system is dynamic, Mexico will not be able to rely permanently on regional preferences to deal with its foreign economic relations.

Mexico's first challenge is to reconcile its regional initiatives with multilateral trade developments. It will strive to attain improved market access and foster a stable world trading environment through multilateral initiatives, and at the same time to maintain its regional concessions for as long as possible. The challenge for the WTO is to generate incentives for countries like Mexico, that are keenly playing the regional game, to be involved in the multilateral trading system.

A second, and perhaps more important challenge, is for the Mexican government to establish closer links between its domestic policies and its international economic policies. Trade liberalization has helped the Mexican economy grow and create new employment opportunities. The benefits of increased trade, however, have not been shared equally. SMEs do not have adequate financing or political representation, especially in the area of trade policy. Likewise, they have not been adequately linked to the great opportunities offered by foreign trade, and account for less than seven percent of exports.[111] Regional disparities have also grown, with the Northern part of Mexico benefiting from economic openness while the Southeast has seen few benefits.

Social advocacy groups have noted that there has not been a marked reduction of poverty or a shift toward more equitable income distribution since Mexico embarked on trade liberalization and a series of complementary reforms. While they neglect to take into account what the situation could be if the economy had remained closed and reliant on oil exports, their concerns are legitimate. The onus is on showing that trade openness,

[109] Secretaría de Comercio y Fomento Industrial, El Tratado de Libre Comercio México-Unión Europea (2000); PowerPoint presentation available at www.economia.gob.mx.

[110] It is worth noting that the WTO Dispute Settlement Understanding provides for binding decisions, while NAFTA's general dispute resolution mechanism, contained in Chapter 20, only provides for recommendations. For a comparison between these two mechanisms, *see* Ortiz Mena L.N., *supra* note 73.

[111] Approximately fifty percent of exports are carried out by large corporations, and the remainder is accounted for by *maquiladoras. See* Antonio Ortiz Mena L.N., *Ten Years of NAFTA: A Mexican Perspective*, 60 Voices of Mexico (2002).

and specifically participation in the multilateral trading system, can be an invaluable instrument in helping the country grow and at the same time share the benefits of growth in a more equitable manner. But that is not an automatic process and will take consistent and concerted effort on behalf of the government and social groups. Making openness work is necessary if Mexico is to maintain an open economy and continue to participate in the multilateral trading system.[112]

I. Introduction

In 1999, the total value of world exports equaled US$5.6 trillion.[1] As a result of the Uruguay Round achievements in liberalizing global trade in goods, world income is expected to increase by US$510 billion (in 1990 dollars).[2] These astronomic figures are alluring for any country, especially one that is in a desperate financial situation.

However, if a country's share in global trade is only 0.01 percent (as in the case of Mongolia) what can it expect to gain from membership in the WTO? Especially given the fact that the WTO advocates free competition, would the participation of such a tiny economy not resemble a rugby match between "elephants" and "mice"? The anti-globalization sentiments so loudly voiced in the recent past in Seattle, and echoed in Davos, Prague, Seoul and New York, appear to make the usefulness of the participation of smaller economies in the WTO even more doubtful. Nevertheless, against all odds Mongolia has been participating in the WTO process. Why is it doing so? Was it indeed attracted by the massive gains expected from trade liberalization, hoping that Mongolia would share in these gains? If Mongolia is to benefit from its membership in the WTO, what measures should it undertake and what constraints must it overcome?

These are some of the legitimate questions raised by many in Mongolia, to which answers will be sought in this chapter.

II. Mongolia's Accession to the WTO

In order to consider how Mongolia has benefited from participation in the WTO, one must ask why Mongolia joined the organization in the first place. The question becomes more relevant in light of the fact that many inside and outside Mongolia believe that the terms of its accession were not optimal, to put it mildly, and set a tough precedent for a number of countries that joined the organization after Mongolia. It is not easy to argue against these opinions when the far-reaching concessions[3] made by Mongolia, as well as the virtual absence of grace periods for implementation that might be thought appropriate for a developing country,[4] are weighed against the serious economic challenges the country was undergoing.

The accession terms were arguably unfavorable because Mongolia's accession took place in a burst of euphoria without serious economic calculations or a solid cost-benefit analysis. At the time of initiating the GATT/WTO negotiations, the Mongolian economy was still a centrally planned and isolated economy with almost every barrier to trade imaginable. Certainly, this system needed to be changed in order for Mongolia to become a member of the WTO. However, it is also worth noting that purely from a negotiating perspective this high baseline seemed to have given Mongolia broad maneuvering room to secure as many developing country benefits as possible. In order to avoid making steep bound concessions across the board, the government and its negotiators could have strived to make as few concessions as possible, in order to secure legitimate "space for maneuver" for the Government if in the future domestic industries suddenly

needed "breathing room" in the form of a level of protection going beyond that which the government considered reasonable at the time of entering the negotiations and to which it bound itself under the WTO. Such a strategy would not have contradicted Mongolia's internal economic liberalization policy, for under the WTO system a country can always liberalize its economy beyond its WTO commitments, while for a small economy like Mongolia, retreating from concessions once made is legally impossible or next to impossible.

Nonetheless, it should be noted that, although from the professional perspective the accession process was far from perfect, so far membership of the WTO *per se* has not impacted the economy negatively, since the Mongolian Government chose to free its economy beyond its WTO commitments.

A. Initiation of Accession Negotiations

Mongolia is the 130th member of the WTO. It became an official member as of January 1997. The negotiations with the GATT began in July 1991.[5]

When Mongolia initiated its negotiations with the then GATT members, of which Australia, the United States, the European Union, Canada, Japan, and Mexico were the most active, it was in a rather peculiar historical period—the beginning of its painful and arduous transition to a market economy. Along with economic reforms, it was simultaneously undertaking far-sweeping democratic reforms. These reforms, coupled with the collapse of the Council for Mutual Economic Assistance ("COMECON") and its market structure, sent the Mongolian economy into a deep crisis.

B. Old Strategy and Mentality Versus the New Realities

Initiating accession into the WTO was apparently among the first genuinely independent foreign political moves made by Mongolia in the multilateral arena. Throughout the Communist era most if not all decisions were politicized and strongly motivated by ideology. In pursuit of the objectives dictated by its rivalry with the West, the Soviet bloc attempted to turn Mongolia into a "showcase" for socialism and therefore gave it large subsidies.[6]

Mongolia's thirty-year-long participation in COMECON ensured Mongolia comfortable trade opportunities such as guaranteed access to the markets of the member economies, "incentive prices" for imports, and a trade deficit financing by the Soviet Union.[7] Consequently, until the early 1980s, despite the distortions and inefficiencies[8]

[5] Ministry of Industry and Trade, *Implementation of the Commitments Undertaken by Mongolia at the Accession to the WTO and Enhancing the Activities of Mongolia in the Organization* (Research Paper, 2001).

[6] David Dapice, *Open Policies in a Closed Country: Making Markets Work in Mongolia*, in TOWARDS ECONOMIC STRATEGIES FOR RAPID GROWTH IN MONGOLIA 3 (Research Paper under the general direction of Jeffrey D.Sachs. 1997).

[7] World Bank, *Mongolia: Toward a Market Economy 3* (World Bank Country Study 1992).

[8] A very vivid example of economic inefficiency could be seen from the experience with the establishment in the 1980s of a footwear factory in Mongolia, which had a capacity to produce 3 million pairs of shoes a year, while the population of Mongolia was a little over 2 million. Given the absence of footwear production experience and expertise in the past this project could not even conquer the sympathy of the internal market, not to mention that of the external. Not surprisingly the factory went bankrupt under the market economy for there was no longer the centralized economic "totalitarian" protectionism in place, which could virtually stop imports and have everyone wear the locally-produced shoes, irrespective of the fact that the factory could supply only a limited variety of designs.

of the centrally planned and ideology-motivated economy, Mongolia enjoyed robust growth.[9] Under the system of "brotherhood" almost any project in Mongolia was doomed to succeed. Therefore, even when economic issues were negotiated, they were eventually decided in the spirit of "brotherly friendship". As a result it was assumed that the larger economies would consider issues relating to the smaller countries favorably in any intra-COMECON dealings. In this environment, which dominated the economic cooperation field for almost thirty years, the instinct of self-interest was arguably weakened a great deal. Hence at the launch of Mongolia's accession process the Mongolian negotiators were apparently not really familiar with the pragmatic, realistic and commercially-driven mentality of the GATT.

However, the countries that negotiated Mongolia's WTO accession played the "game" the usual way, i.e. to gain, regardless of Mongolia's size and experience. The outcome of the negotiations was therefore in a sense predetermined, since they were carried out from such differing perspectives and premises.

In addition to the COMECON mentality, the Mongolian negotiators and decision-makers at the time of initiating the accession process could not rid themselves of the values of the authoritarian past, when the state was seen as the center-point of everything and where the concept of participatory democracy had not yet taken real roots in society. The reforms, whereby the people turned from "something to somebody", began only in the late 1989, whereas the negotiations started in 1991. Consequently, by the start of negotiations the decision-makers and the negotiators simply had not had enough time to change their life-long mentality. As a result there was little consultation with the emerging business community of Mongolia, and limited debate, if any, with the public in general.

The absence at the initial stage of the accession negotiations of a debate with the major national stakeholders who would be directly affected by the WTO rules could also be explained by the fact that there were virtually no private businesses in Mongolia in 1991. The "blue-pink" voucher privatization, i.e. the first wave of privatization of livestock, smaller state-owned factories and government shops began in 1990.[10] Since Mongolia had no private stakeholders operating in the market at the launch of the GATT/WTO negotiations, the objectives identified by the government officials negotiating the GATT/WTO accession arguably reflected the economic interests of the nation as a whole at that time.

However, the nation began to undergo intensive and rapid changes in terms of the private sector share in economic growth. Already by 1995 the private sector was accountable for half of the GDP, and by 1996, the final year of the negotiations, the same indicator stood at over 57 percent.[11] The stake of private entrepreneurs in trade grew even more significantly. The private sector share in trade reached 66 percent and approximately 70 percent in 1995 and 1996 respectively.[12] The bureaucrats could not understand this drastic change and dynamism. If at the beginning of negotiations every commitment made by the negotiators affected the government "pocket", by the end of the negotiations they

[9] For example, between 1960 and 1980 the gross industrial production rose by about seventy percent; the real GDP growth rate in the period between 1981–1986 equaled seven percent. World Bank, *supra* note 7, at 4.

[12] *Id.*

were affecting the private "pocket". Thus, the state-centrist premise was failing to fit the new realities, the full comprehension of which required more contacts and surveys at the grassroots level.

One of the reasons why the growing significance of privatization and the growth of the private sector was overlooked in trade negotiations could be explained by the fact that privatization and the multilateral trading system were each subjects complicated enough on their own to comprehend. While the subject of the multilateral trading system received some scrutiny in Mongolia, the domestic economic imperatives were rapidly changing. Hence, understanding all of the changes taking place in a systemic order would have been a daunting challenge for any individual.

Also, under the former regime, when Mongolia was isolated from the rest of the world the trade diplomats were among the elite of the country in terms of pay and education. In the 1990s entrepreneurs had little experience and knowledge of international trade issues and were therefore ignored by the "sophisticated" and COMECON-experienced trade negotiators, who presumed, as under the previous regime, that they "knew" what the entrepreneurs needed without bothering to consult them.

As a result of the above factors, there was a considerable gap between the business community and the trade negotiators, not only at the early stages of the negotiations but throughout their course.

Another problem (insignificant at first sight, but important in the long run) appears to have hurt Mongolia in the negotiations. From the early 1990s the outflow of government personnel due to steady budget cuts and the increasing attractiveness of the emerging private sector degraded the capacity of the government in general.

C. Time Pressure and the Imagined "Deadline"

As a result of the loss of COMECON's support Mongolia was on its own in the globalizing world economy. In order to fill the vacuum Mongolia needed to exploit every possible means to become integrated into the world economy. It therefore resolved to try various activities, including the GATT/WTO accession negotiations. The fact that neither Russia nor China was a member of the GATT gave Mongolia an incentive to join the WTO before its two big neighbors. The imagined race to accession, while both Russia and China were, in fact, not concerned about speedy accession, created a strong sense of time pressure.

Ironically Mongolia's accession to the United Nations, although it did not require any change in the economy, took almost as long as the Chinese accession to the WTO (i.e. fifteen years), while the WTO accession negotiations, which necessitate far deeper and more fundamental changes in the economic structure of the country, took only six years.

D. Unclear Objectives

Because of the factors mentioned above, WTO accession appears to have become a matter of reputation for Mongolia. Accession was seen as a political card that Mongolia could play in order to become integrated into the world economy, and to create a new image and reputation. In pursuit of these objectives the WTO accession seems to have become an end in itself.

However, the GATT/WTO was not the right institution to join with the politicized objective of image-building. The image-building value of entering the WTO was negligible

Matrix 1.

No.	Factor	Status	Negotiation Results
1.	Economy	Constant	Adequate
2.	Interest articulation mechanism	Constant	
3.	Negotiation process	Variable	

compared to the potential price of the concessions Mongolia had to make. Instead of politicized motivation Mongolia needed a sound cost-benefit analysis to demonstrate in numerical terms how easily and to what extent its exports could penetrate the markets of WTO members, or what it could obtain in return for the concessions it made. So far no hard evidence of the existence of this type of analysis has been found.

The strange symbiosis of historical, social, economic and personal factors mentioned above existed during the accession process. Although the WTO accession decision *per se* appears to have been somewhat spontaneous, based on euphoria rather than any economic rationale, there is little doubt that the decision was historically and economically inevitable. However, the accession process following the decision to join the WTO was not flawless as a result of the factors mentioned above.

The following lesson can be drawn from Mongolia's accession experience. In order to ensure adequate results after accession, with which the majority of society can live without raising any post-accession regrets, a country in launching and conducting WTO accession negotiations should examine the status, behavior and co-relationship of at least two factors *vis-à-vis* the negotiation process, i.e. (1) economic stability and (2) institutionalized and mature interest articulation mechanisms. If these two factors are stable *vis-à-vis* the negotiations, which are to bring changes into the existing economic structure, the accession process may produce predictable results, reflecting the realities more adequately. However, if either or both of these factors were unstable, there would be no reliable premise upon which one could project the objectives and benefits of achieving an agreement. For example, if a country at the beginning of negotiations did not have a particular sector in place that could potentially seek protection, the likelihood of setting liberal objectives for imports of the product(s) in question would be high. If however the sector emerges while the accession negotiations are underway, the objectives set at the start of negotiations would not match the new realities. In short, any country seeking adequate results from the negotiations should at the minimum perform an analysis involving a triple-factor matrix, assessing the economic structure, the interest-articulation mechanism and the negotiation process as to their stability and relationship with each other. To obtain adequate results from the negotiations, only the negotiation process should be variable and the other two stable[13] (see Matrix 1).

In the case of Mongolia all three factors were changing: the economy was in the process of restructuring, the interest articulation mechanism was (and still is) being developed, and the accession process was underway. The rushed approach to WTO accession and the lack of multilateral trade negotiation experience, as well as the absence of consultations with the business community and the public in general over the potential repercussions, benefits and other consequences related to the WTO concessions, resulted in tough commitments for Mongolia.

[13] For the purpose of this chapter the words "stable" and "constant" used with regard to the economy means predictable rather than stagnant and non-changing.

III. Mongolia's Implementation of its WTO Commitments

A. Short Review of the Current Situation

Although the accession process of Mongolia was not impressive, as a member of the global organization the country now has other challenges and issues to tackle. Mongolia is legally bound to comply with and implement the rules and requirements of the organization. It will have to learn to play the global game by the rules in order to eventually benefit from WTO membership.

The Government of Mongolia undertook a series of measures aimed at the implementation of its commitments before the WTO. The Working Party Report[14] and the Protocol for Accession of Mongolia to the Marrakesh Agreement Establishing the World Trade Organization[15] may appear to be non-voluminous compared with similar documents of other members, however, for the small economy of Mongolia, the provisions contained therein were substantial.

In the immediate aftermath of Mongolia's accession to the WTO the relevant government institutions had very little, if any, idea about their role in the implementation of the Mongolian commitments. Hence the government passed Resolution No. 14,[16] whereby it allocated the WTO Agreements to the appropriate ministries and agencies. The allocation *per se* could not ensure the implementation of Mongolia's commitments under the Accession Protocol and WTO Agreements because these agreements were alien to the relevant ministries and agencies of the country. Consequently, starting the "implementation-engine" required a strong and unified leadership, as well as Cabinet level guidance. Decree No. 6 by the Prime Minister of Mongolia ("Decree No.6") was an important act because it listed the laws and regulations that had to be modified and amended in order to bring them in conformity with WTO law.[17]

Through Decree No.6, the government sought to introduce comprehensive changes into the trading regime of Mongolia, including, *inter alia*, the development of a double column customs tariff system, review of the customs valuation rules, reform of the internal taxation system, simplification of exportation and importation procedures, elimination of bans on certain products, and modification of the intellectual property protection regime. From the scale of the measures covered by the decree, it appears to have been an ambitious attempt to bring the whole trading regime of the country into conformity with WTO rules in one take on a structured basis. However, in the course of implementing the measures prescribed in the decree it became clear that building a WTO-consistent trade regime is a continuous process, which has a start, but no end.

The actual implementation of Decree No.6 on a planned, coordinated and structured basis with appropriate monitoring proved to be difficult. This was partly due to the fact that a few months before Mongolia officially became a member of the WTO, the Mongolian government was the subject of a major restructuring. In forming their government, the Democratic Coalition, which won the general election in mid-1996, reduced the number of ministries from fifteen to nine. As a result, the trade section of the Ministry of Trade and Industry was merged into the Ministry of External Relations. The newly formed Department of Foreign Trade and International Cooperation ("DFTIC") of the Ministry

[17] Prime Minister of Mongolia, *Decree No. 6* (1997), Ministry of Foreign Affairs Archives.

of External Relations was appointed as the focal point on WTO matters. The new DFTIC, with a staff of only twenty officers, was also assigned the task of handling official development aid ("ODA") of over US$300 million *per annum* provided to Mongolia by the international donor community. Understandably, in a country suffering from a chronic budget deficit and an overall economic crisis, the management of the ODA was far more significant than WTO compliance. Hence, DFTIC's efforts in coordinating the various ministries and agencies aimed at implementing the Decree No. 6 were not fully devoted and efficient.

Nevertheless, irrespective of the lack of coordination at the inter-agency level, many of the objectives sought through Decree No.6 were achieved rather spontaneously. The country was undergoing a transition to a market economy and the newly elected government was intensively pursuing a policy of liberalizing the economy. Therefore, most of the measures taken in pursuit of such policies ended with good results, which matched or went beyond the objectives of Decree No.6 and the WTO commitments of Mongolia.

1. Tariff System

Although the double column customs tariff system was developed pursuant to Decree No. 6, the need for adopting such a system faded with the nullification of the customs duties by the Parliament in 1997.[18] This move led to liberalization which exceeded the WTO tariff commitments for Mongolia. In acceding to the WTO, Mongolia had agreed to bind its entire tariff schedule at a ceiling rate of twenty percent *ad valorem*, with a few exceptions.[19] The zero-rate tariff regime remained in place for two years. Beginning in July 1, 1999, a general tariff of five percent, with tariff-free access for goods bound to be kept free under the WTO Schedule of Concessions in Goods, was introduced by the Parliament.[20]

2. Customs Valuation

The rules incorporated in the Customs Tariff Law of Mongolia (1996) were developed with the WTO Customs Valuation Agreement[21] in mind. The customs valuation rules are believed to be generally compliant with WTO law,[22] except for some inconsistencies[23] which appear to have stemmed from either the simple misinterpretation of WTO rules or from the state-centrist philosophy of the drafter of the law (i.e. the General Customs Authority), whereby the importers and exporters are presumed to be inclined to avoid customs duties unless thoroughly inspected and controlled. Although the implementation of the Customs Valuation Agreement on the adjudicative level in Mongolia could be argued to be relatively smooth, there remains a lot to be desired at the level of practical field-application of the law by customs inspectors.

[18] Parliament of Mongolia, *Resolution No.4*, April 18, 1997.

[19] *See* WTO, *Schedule CXXXIV-Mongolia: Part I—Goods* ("Schedule of Concessions in Goods"), WT/ACC/MNG/9/Add.1 (1996).

[21] *See* the *Agreement on Implementation of Article VII of the General Agreement on Tariffs and Trade 1994* in WORLD TRADE ORGANIZATION, LEGAL TEXTS: RESULTS OF THE URUGUAY ROUND OF MULTILATERAL TRADE NEGOTIATIONS 172–200 (1999).

[22] *See* Mark Ziegrist, REPORT ON THE CUSTOMS VALUATION RULES (1998).

[23] For example, the principle in Article I:2(a) of the Customs Valuation Agreement that the relationship between the buyer and the seller may not be a *prima facie* ground for refusing to accept the transaction value (*See* chapter 12 of this book) is used in the reverse sense in Article 13.4.4, Customs Tariff Law (1996) of Mongolia, i.e., the relationship is viewed to be a *prima facie* ground for non-acceptance.

3. Internal Taxation

The reforms affecting Mongolia's internal taxation system proved to be difficult. The review of the Working Party Report suggests that the sales tax, as well as the discriminatory excise tax imposed on certain products (e.g. alcoholic beverages), were scrutinized by the negotiators in a fairly intensive manner.[24] Although as a result of the WTO accession, the excise and sales taxes were subjected to reforms, the discrimination with regard to spirits and certain types of alcohol still remains intact. The preservation of discrimination may not be justified by a lack of knowledge of WTO discipline. The practice of imposing or lifting new excise taxes evidences that there is awareness about Mongolia's commitment to respect the national treatment principle. The imposition and abolition of the excise tax on beer is a clear example of such awareness. In 1998, when an issue on the excise tax on beer was debated, the first bill provided for the discriminatory treatment of imported beer. However, a US$0.50 excise tax was imposed equally on both domestic and imported beer precisely due to the requirements of Article III, GATT 1994. The abolition of the beer excise tax in 2000 was also effected in a manner consistent with the national treatment principle.[25]

The sales tax was abolished in favor of a value-added tax in 1998. However, the Law on the Taxes on Added Value ("VAT Law") inherited the discriminatory nature existing under the sales tax law, under which a domestic producer was exempt from the tax if its total sales were below five million tugruks *per annum*, but an importer bringing into the country products identical and/or similar to that of the domestic producer was subjected to the sales tax irrespective of its sales turnover.[26] The VAT Law is similarly discriminatory, the only difference being the level of the threshold.[27] Although one may argue that this discriminatory provision in the VAT Law falls outside the scope of GATT Article III, because on its face it discriminates between producers and importers, rather than between domestic and imported products, in practice of course its application does lead to discrimination in a manner that affords protection to the domestic producers.

4. The Harmonized System

The introduction by the Government of the Harmonized System ("HS") marked a serious step forward in the facilitation of trade promotion. The translation of the HS was published in 1998. Currently, the HS is widely applied for such matters as the classification of goods for customs clearance, licensing procedures and other non-tariff measures.[28]

5. Import and Export Licensing

The licensing procedures were also subject to reform. Mongolia undertook to reduce the number of products subject to import and export licensing. Here, the liberalization was carried out during the accession negotiations. The licensing requirements for exports of meat, grain and fodder imposed under Government Resolution No. 86[29] were lifted in 1995. Export licensing for ferrous and non-ferrous metals mandated under the same

resolution were abolished in 1996. As for the products still covered by the licensing requirements, the term of the licenses were extended from three months to one year.[30]

6. Ban on Exports of Raw Cashmere

During the accession negotiations, Mongolia had a ban on raw cashmere exports in place. Upon entry into the WTO, Mongolia undertook to lift the ban. In pursuit of this commitment, Mongolia abolished the ban and introduced an export duty. As discussed below, the government applied the export duty in a fashion that caused considerable harm to the Mongolian industry.

7. Transparency

Mongolia's efforts to ensure transparency in its laws and regulations had significance for Mongolia because it strengthened democracy and compliance with WTO law. When Mongolia acceded to the WTO, the Parliament and the Government had their own media channels through which to reach the public. However, with further democratic developments, a new law concerning the mass media was passed, allowing the media to become more independent. To facilitate the actual independence of the media, the affiliations of certain media channels with the government were ended. Consequently, there were no media channels required by law to publish new decisions, regulations and laws. This situation has been addressed by a Parliamentary resolution, under which all the decisions and regulations by the legislature and the executive branch of the Government are required to be published officially in the "Government Bulletin".[31]

8. Intellectual Property Rights

In the field of intellectual property rights protection, Mongolia undertook appropriate measures to ensure compliance with the WTO TRIPs Agreement. In this context Mongolia joined the Berne Convention for the Protection of Literary and Artistic Works and amended its Law on Copyrights (1993), as well its Patent Law (1993).[32] In 1998, the TRIPs Council of the WTO reviewed the intellectual property rights regime of Mongolia and recommended that Mongolia focus more on the enforcement mechanism.

B. Evolution from Accession-Orientation to Implementation-Orientation

A review of the WTO accession and implementation shows that the euphoria and rhetoric on the heightened international image of Mongolia ended shortly after the completion of the accession process. As Mongolia became a member of the WTO, it began to face the challenges associated with membership.

Due either to a slightly distorted understanding of the objectives of acceding to the WTO or to the accidental coincidence of legal reform efforts of Mongolia with post-accession measures, Mongolia strongly emphasized the implementation of WTO obligations. Strangely, there was virtually no substantial discourse over the improved market access of Mongolian export products, which could be expected to be the major goal of any developing member state.

[30] Minister for Agriculture and Industry, *Procedures on Licensing the Products subject to the Exportation and Importation under the Government Supervision*, Order No.A-34 (September 30, 1996).

[31] Parliament, *Resolution No.103* (1998).

[32] Mongolia has further been endeavoring to extend its treaty base by recently joining and ratifying (in May 2002) the WIPO Copyright Treaty, the WIPO Performance and Phonograms Treaty, and the Nairobi Treaty on the Protection of the Olympic Symbol.

The heavy emphasis on implementation is evidenced from the fact that during the first years of membership there were a number of government acts and decisions, such as Decree No.6, adopted to ensure Mongolia's compliance with WTO rules. There were few, if any, decisions or measures calling for an assessment of the prospects of Mongolian export expansion resulting from accession to the WTO.

Nevertheless, the implementation-orientation of the Government did not mean that the WTO issues were constantly high on the agenda. The dramatic economic transition understandably overshadowed participation in the WTO. However, whenever the WTO issues were raised, the implementation of the Mongolian obligations was put on the agenda. This suggests that Mongolia associated WTO membership, first of all, with the implementation of its obligations. This implementation-oriented approach derived from the fact that the Mongolians saw the WTO as the "Gattzilla", which could come down on Mongolia with severe punishment if it did not comply with its obligations However, no one in Mongolia appears to have questioned whether complying with the WTO requirements would bring benefits to Mongolia. The lack of questioning seems to have stemmed from the assumption that this "Gattzilla" somehow was seen at the same time as an organization whose principles could lead to reform of Mongolia's nascent commercial system. Unlike many developed Western countries, in Mongolia the term "international" is frequently viewed as more mature and, thus, better than "local". Indeed, many of the concepts introduced by, or because of, the WTO undeniably improved and made the Mongolian commercial system more mature in many respects, such as the reforms of the customs valuation rules, the introduction of the HS, and the attempts to simplify the licensing procedures. The WTO was considered by the Mongolians as the body combining two controversial images; on one hand, the tough "Gattzilla", if opposed, and the virtuous "Guru", if complied with. The Mongolians took for granted that compliance would benefit Mongolia, although there was no clarity as to how exactly this would occur.

C. Is Membership Burdensome?

Some public figures and economists in Mongolia express concern that for a small developing country like Mongolia, tough commitments and disproportionately few special and differential treatment provisions place a heavy burden on the economy.[33] The concerns are legitimate if one examines the potential impact on manufacturing and processing. In addition, the non-participation in the WTO of Mongolia's two big neighbors, China (up until 2001)[34] and Russia, put great pressure on Mongolian producers. Also, the tariffs maintained by China and Russia were higher than those of Mongolia, which substantially reduced (and for two years even eliminated) import tariffs in the second half of the 1990s. This sort of unilateral liberalization policy can hardly be afforded by major trading nations, let alone Mongolia.

As was mentioned above, Mongolia's entire industrial base was built on the philosophy that there was no place for concepts such as competition or lack of markets. Liberalization hit Mongolian industries hard and international competitive pressure pushed most

[33] *See, e.g.*, statement by S.Oyun (MP), The Globalization, Mongolia and its Foreign Policy, in INTER-POLITICAL PARTY DISCUSSIONS: THE GLOBALIZATION, MONGOLIA AND ITS FOREIGN POLICY NO.5, Gan Print, Ulaanbaatar, at 23–27 (2003) and the intervention by S. Dashzeveg, at 45–48.

[34] Even now that China is a member of the WTO, the positive impact of its membership has yet to be felt in Mongolia.

of the enterprises out of the market both internationally and domestically. However, it is important to note that the WTO-induced liberalization did not cause the economic downturn. The economy had been ailing long before WTO rules became legally applicable in Mongolia. The peak of the crisis occurred in the early 1990s when GDP dropped by 16 percent (1991)[35] and inflation raged at 325.5 percent *per annum* (1992).[36] Moreover, the trade indicators were also unstable in the early 1990s. In 1991, total trade turnover shrank more than twofold from US$1,584.7 million to US$708.9 million.[37] After this sharp decrease, trade turnover began to gradually increase and the trade balance started to recover.

Mongolia experienced these trade fluctuations before its accession to the WTO. Therefore, the downturn in trading terms could not be associated with membership of the WTO. The fact that the trade deficit grew by 520 percent from US$25.4 million to US$ 155.6 million[38] in 1998, the first year after accession to the WTO, was mere coincidence. The major factors causing this were the 1997 Asian crisis,[39] which reached Mongolia a year later, and the aggressive liberalization, which led to a surge of imports.

Consequently, even though WTO accession brought about far-reaching concessions by Mongolia, which under normal circumstances could have put great pressure on the economy, the nation's membership in the organization has not been too painful. The situation may however change with a revival of the industrial sector. It is too early to reach any definite conclusions. Some businesses have already voiced their concern, the most vocal being the cashmere processors.

Two specific examples of industries that faced difficulties as a result of Mongolia's accession to the WTO are cashmere and scrap metal.

Cashmere

Since the cashmere sector is one of the top hard currency earners in the country it clearly deserves special interest. Mongolia is a small economy and has only a few industries that are arguably integrated into the world economy. These few sectors basically set the mood in the industrial sector as a whole. Therefore, these are the primary sectors whose interests should be consistently taken into account in the actions of the Mongolian Government in the global forum. The cashmere sector is not only large in Mongolia, but it is substantial even at the global level. Mongolia accounts for 25 percent of world cashmere production, ranking second after China.[40]

Before Mongolia's accession to the WTO, the cashmere processing industry enjoyed a comfortable business environment as the economy opened up, on the one hand, and the ban on raw cashmere exports was maintained, on the other. According to some sources, the raw cashmere export ban introduced in 1994 laid the preconditions for the inflow

Some have estimated Mongolia's share of total world production to be as high as forty percent. *See, e.g.*, Myatavyn Tumurjav, *Traditional Animal Husbandry Techniques Practiced by Mongolian Nomadic People*, in MONGOLIA TODAY: SCIENCE, CULTURE, ENVIRONMENT AND DEVELOPMENT (Dendeviin Badarch, Raymond A. Zilinskas, *et.al.* eds 2003), at 95.

of foreign investment into the cashmere processing industry.[41] Foreign investors, a third of whom came from the industrialized countries,[42] realized in making an investment decision that the favorable trade regime fortified by favorable tax treatment could not last too long because it could have a great distorting impact on the economy and simply because it was almost too good to be true. In the course of the WTO accession negotiations, the export ban was replaced by a thirty percent export duty, to be gradually eliminated over ten years.[43] The investors from the industrialized countries with their business mentality formed in economies where a change of a business environment occurs gradually and transparently (often with a noisy debate), were not ready for such an abrupt turn of events, where the government did not even engage in any inquiry into the effects of the change. The investors also apparently knew from the experience of their own countries that tariffying the ban would have a considerable effect. However, going all the way down to thirty percent must have been shockingly unexpected.

To make matters worse, in introducing the export duty the Mongolian authorities did not opt for an *ad valorem* rate, but instead imposed a specific rate of 4,000 tugruks, which was roughly equal to thirty percent of the export value of raw cashmere at the time of introduction.[44] However, with an almost fourfold rise of the world price for cashmere the 4,000 tugruk rate was often equivalent to less than ten percent of the value. The foreign investors, as well as the Mongolian producers, therefore expressed dissatisfaction with the WTO accession results, which were exacerbated by the incompetence or inexperience of the Mongolian authorities.

The above discussion shows that the cashmere industry was hit harder by the Government's implementation of the WTO commitment than by the WTO commitment itself. By introducing a specific rather than an *ad valorem* tariff, the Mongolian Government unintentionally liberalized the cashmere market more than it had committed itself to do.

Scrap Metal

The scrap metal melting plant financed by a Japanese loan serves as an example of a substantial (by Mongolian standards) project affected negatively by WTO membership. In accordance with the feasibility study related to the establishment of the plant, at the initial stage of operations it was supposed to process scrap metal accumulated in Mongolia throughout its pre-reform period. However, with the lifting of the export licensing requirements under a WTO commitment,[45] most of the scrap metal left the country for China. As a result during its start-up phase the plant could not rely upon cheaper local raw material until it became more competitive and mature. The plant survived the struggle, and was subjected to a management buyout in early 2002, since when its business has reportedly stabilized.[46]

An analysis of the WTO commitment implementation process in Mongolia can be characterized, in general, as a process in which Mongolia endeavored to appear as a good student in the eyes of the global "Guru". In other words, the Mongolians put strong emphasis on becoming a WTO-compliant country. Although the first years of

[46] Statement by Mr. Ch. Ganzorig, Minister for Industry and Trade, during an interview on Mongolian National Television, November 29, 2002.

Mongolia's membership in the WTO coincided with the economic crisis in the country, the introduction of WTO-based rules in Mongolia, with the exception of a few cases, is not linked to the economic problems in Mongolia, no matter how high the temptation may be to blame WTO rules. Thus, WTO membership has not placed much of a burden on Mongolia's basic economy. However, given the virtual absence of any external gains through, for example, growth of exports, membership may be seen as burdensome to the extent of the internal implementation costs. But these costs are worth bearing since the price of staying out of the WTO would be immeasurably high.

Mongolian trade policy-makers should not relax despite the unquestionable importance of WTO membership. They should always keep in mind the expressions of doubt coming from different corners of society. Especially today, with the recovery of the economy, many tenets of the current trading regime may be subject to compelling criticism.

IV. The WTO in Operation

A. Cashmere and the WTO-IMF-World Bank Coherence Test

Although Mongolia is a small economy, some of the issues debated at the global level have already been tested on Mongolian soil. The WTO-IMF-World Bank complementarity and coherence issue was one such issue. Not surprisingly, in view of its importance to Mongolia's economy, cashmere was the subject over which the substance of the global debate was put to test. After the problem with the export tax discussed above, the cashmere producers, realizing that the reinstatement of the export ban would be inconsistent with Government policy and with Mongolia's WTO commitments, asked the Government to change the export duty from the specific rate to thirty percent *ad valorem*. This would have been consistent with the WTO commitment so long as it was "gradually" reduced over ten years. However, another global institution, the IMF, which has a lead role in facilitating donor community support in Mongolia, opposed this change.

Rather than simply accepting the IMF position, the Mongolian Government, bearing in mind the cooperation agreement between the WTO and the Bretton Woods institutions on achieving greater coherence in the global economic policy-making,[47] raised the issue with the WTO Secretariat.[48] Mongolia argued that both the WTO and IMF were international institutions of equal status. Therefore, in Mongolia's eyes, the legal rights protected under the WTO could not be impaired by a policy position of another international institution of the same caliber. Mongolia argued that since there was an agreement to ensure coherence between the global institutions, changing the specific export duty rate to an *ad valorem* rate within the thirty percent range, as agreed with the WTO, should not be challenged by any international organization. Moreover, the thirty percent *ad valorem* rate was the result of six years of negotiations and, if it was accepted that another international organization could easily prevent the enjoyment of the right, the value, integrity, and reliability of the entire WTO multilateral legal system could be put in question.

The WTO Secretariat responded to the Mongolian arguments positively, but in an evasive manner.[49] It confirmed that Mongolia's Government would indeed be free to

[47] *See, e.g.*, *Declaration on the Contribution of the World Trade Organization to Achieving Greater Coherence in Global Economic Policymaking*, in LEGAL TEXTS: RESULTS OF THE URUGUAY ROUND OF MULTILATERAL TRADE NEGOTIATIONS 386–387 (1999). *See also, Singapore Ministerial Declaration*, WT/MIN(96)/DEC (18 December 1996), ¶5.

[49] *See* Letter from the WTO Director-General to the Prime Minister of Mongolia, dated May 18, 2001, Ministry of Industry and Trade.

apply an export tariff at a rate not exceeding the thirty percent limit. However, it went on to state that this issue could be resolved in the context of Mongolia's consultations with the IMF and the World Bank, thus disassociating the WTO from the debate and leaving Mongolia on its own *vis-à-vis* the IMF. As a result the specific rate is still in place.

B. Customs Valuation: Law v. Practice

The level of the export tax was not the only problem that the cashmere processing industries faced in Mongolia. The cashmere producers also challenged the application of the customs valuation rules to the export tax by the Mongolian Customs authorities. The dispute had been initiated by a cashmere processing company with foreign investments and was supported by a number of other companies. The complaint was that the Customs authorities have been systematically rejecting the prices declared by the exporters and instead applying the highest or close to the highest price registered with the customs authority in the year in question, despite substantial price fluctuations.[50] The authorities claim that this approach was consistent with the Customs Tariff Law of Mongolia and the WTO Customs Valuation Agreement.[51]

The cashmere producers challenged the practice on the grounds that:[52]

i. The Customs authority could not invoke both the Customs Valuation Agreement and the Customs Tariff Law of Mongolia (irrespective of its provision on the export value being the *franco*[53] border of Mongolia price)[54] in defense of the practice, since neither the law nor the Agreement applied to the calculation of export taxes;
ii. Even if the provisions of the Agreement and the Customs Tariff Law on the methods of valuation of imports could be applied to export value on the *mutatis mutandis* principle, the Customs authority could not use the "higher of two alternative values".[55]

Although the exporters carried out fairly intensive consultations with the Customs authorities, the latter never fully accepted the exporters' arguments. Although Customs "conceded" by agreeing to use its database, which would not be too outdated, for determining export value, it still did not eliminate the opportunity to opt for a higher alternative price.

In the course of analyzing the customs valuation dispute, a flaw was identified in Article VII, GATT 1994, and the Customs Valuation Agreement, i.e. that their detailed valuation rules do not apply to export valuation. Although GATT Article VII:1 covers valuation of exports as well as imports, the detailed valuation rules contained in paragraphs 2–5 of

[50] *See* Letter of the Group of Cashmere Producers and Legal Opinion Submitted to the General Customs Authority, of the Group of Cashmere Producers, Mon Forte LLC Archives (2000).
[51] *Id.*
[52] *See* Legal Opinion submitted to the General Customs Authority, *supra* note 50.
[53] Italian term for "free". Although internationally the term "franco" (e.g. "franco [named place]") should be avoided as non-standard, the term remains in use in Mongolian law. For more on this, see, Working Party on Facilitation of International Trade Procedures, Geneva, January 1996, Recommendation No.5, third edition, ECE/TRADE/202 [Edition 96.1].
[54] Article 10.4, Customs Tariff Law of Mongolia, does not provide for specific rules and methods of calculating the *franco* border price.
[55] *See* Article 7.2(b), *Agreement on Implementation of Article VII of the General Agreement on Tariffs and Trade 1994.*

Article VII apply only to imports. Similarly, the Customs Valuation Agreement applies only to imports.

A possible way to solve the flaw might be the development of another instrument on the basis of GATT Article VII that would govern customs valuation for export purposes. The customs valuation rules for exports are needed because there are countries that apply export duties. It should also be remembered that even in countries where there are no export duties at present, there could be a time when they may have to resort to such duties on a temporary basis. Therefore, unless harmonized rules are worked out within the WTO, similar problems to that described above could arise in the future.

C. Mongolian Court Enforcement of TRIPS Rights

Although Mongolia is one of the newer members of the WTO, the WTO rules have already penetrated deeply into the fabric of Mongolian society. A good illustration of this is a recent court case in which a foreign investor successfully invoked the provisions of the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights and was awarded a judgment by the court. The very fact that a plaintiff resorted to the TRIPs Agreement (the agreement least likely to be understood by the Mongolian business community) suggests that WTO law may be spreading its roots deep into Mongolian society.

The case was brought by The Wagner Asia Equipment, LLC, a company with U.S. investors that has operated in Mongolia since 1996[56] and has firmly established a good image in the Mongolian market. As the reputation of the company grew, so did the popularity of the company's trademark. However, Wagner had failed to register the trademark with the Intellectual Property Office of Mongolia ("IPO"). A Mongolian company, Borogchin LLC, which had subsequently managed to register the trademark, brought a legal action against Wagner in order to prevent it from using the trademark.

In response to the action Wagner sued the IPO based on unlawful registration of its trademark and requested the court to stay its consideration of Borogchin's complaint until the court decision in the case against the IPO was delivered. Its suit against the IPO argued that at the time the trademark was registered, it was already a well-known mark. Therefore, under Article 4.3.6 of the Mongolian Law on the Trademark and the Economic Entity Name ("LTEEN"), it could not be registered.[57]

Although the Mongolian intellectual property law provides for the protection of well-known trademarks, it has a serious deficiency in that it does not provide a mechanism to determine a well-known trademark. Additionally, the IPO did not maintain a database for well-known trademarks. Therefore, under Mongolian national law, it would have been impossible to prove that the trademark used by Wagner had, in fact, become a well-known trademark by the time Borogchin applied for the registration. The court therefore filled the gap by reference to Article 16.2 of the TRIPs Agreement, which provides that "[in] determining whether a trademark is well known, Members shall take account of the knowledge of the trademark in the relevant sector of the public, including knowledge in the Member concerned which has been obtained as a result of the promotion of the trademark". Wagner was able to satisfy the court, through means of a survey, that as a result of aggressive marketing and advertising it had made its trademark well known in the

[56] *See* Wagner Application attached to the Sukhbaatar District Court, *Decision No. 452*, May 10, 2001.

[57] Article 4.3.6 provides that designs similar or identical to a well-known trademark owned by one entity may not be registered by the IPO as the property of another entity whether or not the mark was registered with the IPO by the owner.

mining industry of Mongolia and beyond. As a result, the court sustained Wagner's claim and held that the Borogchin trademark registration was void.[58] Although the respondent appealed the district court decision, the Capital City Court upheld the decision.[59]

These examples demonstrate that WTO law is becoming widely known and is spreading within Mongolian society. The WTO has in fact managed to improve the Mongolian commercial legal environment. The examples suggest that Mongolian businesses could reap tangible benefits once they master WTO rules.

V. Should Mongolia Remain in the WTO?

The spread of anti-globalization activities and concerns expressed by certain industries in Mongolia has raised a question as to the rationality of Mongolia's membership in the WTO. Despite the question, no country in this ever-globalizing environment can afford to remain isolated. Globalization is inevitable and is not a matter of choice for states. This is especially the case for small economies, since without the WTO rule-based system small economies are confined to limited markets. The WTO rule-based system creates the opportunity for business entities in small countries to attain economies of scales.

Membership in the WTO is therefore an important goal for small countries. Smaller countries can secure gains through full exploitation of the opportunities offered by the WTO in the global market. The WTO, with its strengthened dispute settlement mechanism, facilitates, or aspires to facilitate, an equal and fair environment for businesses from all member countries. Hence, irrespective of the tough requirements, Mongolia should remain in the WTO and participate actively in future negotiations to ensure that its interests are reflected at the global level.

An assessment of the five-year membership record of Mongolia in the WTO suggests that the tangible membership benefits or challenges Mongolia could have are, to a large extent, still in the realm of "what is possible". Whether these opportunities materialize depends on Mongolia's own efforts. The WTO fundamentally remains an organization focused on sound economic and commercial reasoning, notwithstanding the development provisions in Part IV of GATT 1994, the concept of an integrated framework for technical assistance, or the Doha development agenda. Whether Mongolia manages to secure real benefits out of its participation in the WTO will depend first of all on its economic recovery and its capacity-building activities, aimed at strengthening its government institutions, academia and business community. The Mongolian Government, recognizing the importance of capacity building, together with the GTZ, a German technical cooperation agency, launched a €1.5 million project on trade policy.[60]

The project's objective is to ensure better utilization of the development opportunities available to Mongolia by virtue of its WTO membership. The project aspires to achieve the objective through the realization of the following components:

i. elaboration and implementation of a coherent national trade policy in compliance with WTO commitments and concessions;
ii. strengthening national capacities in trade policy analysis, strategy development, negotiations and implementation; and
iii. improvement of the national legal and institutional framework.[61]

[58] *Decision No. 452*, *supra* note 56.
[59] Capital City Court, *Decision No. 533*, June 18, 2001.
[60] Ministry of Industry and Trade of Mongolia and GTZ, *Understanding and Utilizing the Prospects of the World Trading System* (Project Papers), at 4.
[61] *Id.*

The project demonstrates an interest in benefitting from WTO membership, indicating that Mongolia is on the right track. However, an analysis of the project goals suggests that the Government has not yet overcome its implementation-oriented mentality. Efforts aimed at improving the export capacity of Mongolia are mentioned only marginally and indirectly, if at all, in the description of the project components. In very simplified terms, Mongolia's international trade consists of two elements: imports and exports. Compliance with the WTO commitments and improvement of the internal legal framework will improve the conditions for imports. This is undoubtedly good because these measures, among other benefits, lower the prices of goods (helping consumers), reduce the production costs of import-dependent industries, demand efficiency from domestic producers through increased competition, and improve the regulatory environment for businesses. These are definitely important attributes of WTO membership. However, without an effort to improve the trade deficit through the increase of exports, Mongolia's gains will look extremely one-sided. The vast opportunities open to domestic industries have to be analyzed, measured, and brought home to the national producers, service providers and foreign investors. In the meantime, it also should be made very clear that the WTO is not a donor organization or a development generator. Mongolian trade and development success lies with Mongolia itself; all that the WTO can do is assist through ensuring better market opportunities.

The improved market access opportunities are a great incentive for producers. Although as a result of WTO membership, market access opportunities for Mongolian exports have improved in over 140 countries, access into two of the most important markets for Mongolian products, Russia and China, still has room for improvement. China's accession to the WTO should ameliorate the situation.

For Mongolia, one of the significant advantages of joining the WTO before China and Russia would have been the opportunity to engage in their bilateral accession negotiations as a member of a larger group. Mongolia missed such an opportunity with China. Negotiations are underway with Russia. Mongolia has the backing and sympathy of the global trade organization, and should try its best to strike a good deal with the Russians. The opening of the Russian market for Mongolian products may have a crucial impact on the economy of Mongolia. Also, it may change the attractiveness of the economy for foreign investors as well.

Another important subject that could be discussed between Mongolia, China and Russia within the WTO framework is freedom of transit, critical to Mongolia as a landlocked country. GATT Article V, which covers freedom of transit, has already been scrutinized by some Members, and other international organizations, with a view to improving the provision.[62] In recent years, Mongolia has been negotiating a trilateral framework agreement on transit with China and Russia. UNCTAD has facilitated the negotiation of the agreement.

At present, there are numerous modern regional transit agreements in various parts of the world.[63] However, GATT Article V is based on principles developed in 1921.[64] As a result, Canada's proposed clarifications and improvements of the provisions,[65] and

[62] *See, e.g.*, Communication of Canada, *Trade Facilitation: Article V of GATT 1994 on Freedom of Transit*, G/C/W/424 (October 1, 2002); UNCTAD Communication, *Freedom of Tranzit: Obligations and Implications of Article V General Agreement on Tariffs and Trade*, G/C/W/427 (October 8, 2002).

development of a new general agreement setting forth globally accepted uniform principles based on Article V, may further the trade facilitation efforts of the WTO. This may also consolidate or improve the rights of Mongolia under the pending trilateral transit agreement.

In addition to the above efforts to maximize its benefits, Mongolia should keep in mind one issue, which needs the development of a solid strategy. Ironically, by joining the trade club Mongolia has gained the opportunity to benefit substantially from the restrictions maintained by certain countries in the textiles sector. The quota-free access of textiles from Mongolia to the United States, which Mongolia gained through its accession to the WTO, has given Mongolia a strong competitive advantage over those textile-producing nations that are subject to restrictions. When the Multifibre Arrangement is phased out at the beginning of 2005 and textiles are fully integrated into the WTO regime, the effect on the Mongolian textile industry may be negative. Mongolian policy-makers need to work on designing policies to mitigate the looming change.

In conclusion, it should be observed that, regardless of a certain amount of scepticism and pessimism, Mongolia's overall expectations from its participation in the multilateral trading system appear to be positive and optimistic. However, encouraging critical analysis and questioning within society is essential to secure a healthy policy-making environment.

* At the time of writing (May 2003) the author was serving as Deputy Chief of Mission at the New Zealand Embassy to the United States in Washington DC. The views expressed in this chapter are those of the author and should not be taken as necessarily reflecting the views of the New Zealand Embassy to the United States, the New Zealand Ministry of Foreign Affairs and Trade or the New Zealand Government.

I. Introduction

This chapter summarizes New Zealand's experience with the WTO to date, including its participation in the Uruguay Round of multilateral trade negotiations that established the WTO and the benefits New Zealand derived from those negotiations. The broad objectives of New Zealand's trade policy, as pursued through the WTO "Doha Development Agenda" (hereinafter referred to as the Doha Round) and other trade negotiating processes, are briefly outlined together with the domestic economic and political context which underpins that policy. Specific New Zealand negotiating objectives and proposals in the main areas of the Doha Round are summarized.

New Zealand is a founder member of the WTO and has been active in the evolution and governance of the multilateral trading system since the inception of its predecessor organization, the General Agreement on Tariffs and Trade, in 1947.

Much of New Zealand's approach to the WTO can be understood by appreciating what can be termed the "1-2-3" of New Zealand's place in the world. Roughly speaking, New Zealand comprises rather less than 0.1 percent of the world's population, produces 0.2 percent of the world's output—as measured by GDP—and accounts for 0.3 percent of the world's trade. So New Zealand is a small, prosperous country and a relatively large trader. Two-way trade in goods and services represents significantly more than half of New Zealand's GDP. Simply put, trade is vital for New Zealand's prosperity and economic development. New Zealanders could not hope to maintain, let alone enhance, their standard of living without international trade.

The structure of the New Zealand economy is not dissimilar to that of most "developed" economies. By far the majority of activity—almost seventy percent—takes place in the services sector with "goods-producing" industries accounting for 22 percent and "primary industries" just over eight percent.[1]

The pattern of New Zealand's trade, however, both by country and product, is less typical and explains much of its trade policy. New Zealand is a global trader, trading with almost two hundred countries. Its trade is also relatively balanced geographically. Australia is the largest bilateral partner taking around nineteen percent of exports and supplying almost 23 percent of imports. Australia is followed by the European Union (sixteen percent and nineteen percent respectively),[2] the United States (15.5 percent and 13.5 percent), and Japan (twelve percent and twelve percent). The majority of New Zealand's economic interaction is in the Asia Pacific region[3] which comprises over seventy percent of two-way trade and a similar proportion of FDI and tourist flows. Within the APEC region, East Asia accounts for 33 percent of New Zealand's merchandize trade and the Americas seventeen percent.[4]

[1] "Primary industries" comprise agriculture, fishing, forestry, and mining and quarrying. "Goods-producing industries" comprise manufacturing, electricity, gas and water, and construction. Of these agriculture constitutes almost six percent of GDP and manufacturing around seventeen percent. Figures are for the year ended March 31, 2000. Source: NEW ZEALAND OFFICIAL YEARBOOK 2002.

[2] The numbers in each bracket denote respectively the percentage of exports and the percentage of imports.

[3] As defined by the 21 member economies of APEC (Asia Pacific Economic Cooperation). APEC's members are Australia, Brunei Darussalam, Canada, Chile, China, Hong Kong, Indonesia, Japan, Korea, Malaysia, Mexico, New Zealand, Papua New Guinea, Peru, Philippines, Russia, Singapore, Chinese Taipei, Thailand, United States, and Vietnam.

[4] Percentage figures in this and the subsequent three paragraphs are from NEW ZEALAND EXTERNAL TRADE STATISTICS, YEAR ENDED DECEMBER 2002, published by the New Zealand Ministry of Foreign Affairs and Trade.

merchandize exports, which totalled NZ $29.8bn in 2002, remain heavily concentrated in agricultural products which continue to face some of the most significant global trade barriers. In aggregate agricultural products comprised 52 percent of New Zealand's total merchandize exports in 2002, compared with the OECD average of around seven percent. Dairy products, at 21 percent of total merchandize exports, were the largest single category followed by meat at fifteen percent.

Among non-agricultural products principal export categories in 2002 were forestry and forestry products, eleven percent of total merchandize exports; machinery, 6.4 percent; metal and metal articles, 6.0 percent; and fish, 4.6 percent.

New Zealand is also a significant services trader with exports of services growing rapidly in recent years. In 2002 services exports totalled just over NZ$11bn, 27 percent of total exports. The largest single services export category is tourism which, in 2002, contributed an estimated NZ$6bn to export receipts. Education of foreign students is another fast growing services export activity contributing more than NZ$1bn in foreign exchange during 2002.

A similar situation exists in respect of capital markets. While New Zealand captures only around 0.8 percent of global FDI (foreign direct investment) flows, imported capital looms large in New Zealand's economic development. Indeed, New Zealand ranks amongst the highest of the OECD economies for the 'significance' of FDI; the index number for New Zealand being 31.8 in comparison with 16 for Australia, 12.5 for the United Kingdom and only 6 for the United States.[5]

The total stock of FDI in New Zealand as of December 2001 was valued at NZ$ 49bn, around 47 percent of GDP, with net annual inflows for the five years from 1997–2001 averaging approximately 5 percent of GDP. Of this stock 35 percent was of Australian origin, 31 percent from the EU (dominated by the United Kingdom) and around 14 percent from the United States. Portfolio investment is also significant with foreigners owning about half of all shares listed on the New Zealand stock market and companies that are at least 25 percent foreign owned earning around 40 percent of business profits. By comparison New Zealand's stock of outward FDI in 2001 stood at less than NZ$ 15bn, with 63 percent of that invested in Australia.[6]

II. New Zealand's Trade Policy

As with other major areas of economic and regulatory policy, trade policy in New Zealand is established and implemented, where necessary through legislation, by the central government. The Ministry of Foreign Affairs and Trade[7] is responsible for the coordination of policy advice and policy delivery through its international representation and negotiation functions.

A range of other government agencies are involved in providing input to policy advice and increasingly to delivery. These include other coordinating agencies such as the

[5] The FDI "significance" index as reported by UNCTAD incorporates FDI inflows as a percentage of gross fixed capital formation, FDI inward stock as a percentage of GDP, value added of foreign affiliates as a percentage of GDP, and employment of foreign affiliates as a percentage of total employment. Figures are based on 1997 data as reported in the UNCTAD World Investment Report 2000.

[6] Investment statistics in this paragraph are sourced from Appendix A of a July 2002 briefing paper on the New Zealand Overseas Investment Commission; *see* www.oic.govt.nz.

[7] As with Australia and Canada, the Ministry of Foreign Affairs and Trade in New Zealand combines the foreign policy and trade policy functions. A separate government agency, New Zealand Trade and Enterprize, is responsible for trade promotion and investment attraction.

Ministry of Economic Development, the Treasury, and the Department of Prime Minister and Cabinet; and a variety of agencies with particular responsibilities such as the Ministry of Agriculture and Forestry, Ministry of Fisheries, Ministry of Transport, Ministry for the Environment, and the Ministry for Maori Development (Te Puni Kokiri). In addition to the official policy coordination apparatus, there is also an active programme of consultation and outreach with non-governmental stakeholders to ensure for example that the perspectives of Maori, business, environment and labor groups are taken into account in the policy formation process.

As with all areas of policy, any commitments the government enters into in the area of trade need to be consistent with the government's obligations under the Treaty of Waitangi, the founding document of the modern state of New Zealand, signed in 1840 between the Crown and Maori, the indigenous people of New Zealand.

Given the composition of New Zealand's merchandize exports, the existence of agricultural trade barriers inhibits New Zealand's ability to grow through trade, as is also the case with many developing countries. Estimates vary widely but some studies suggest that trade barriers globally could cost New Zealand up to nine percent of its GDP annually.[8]

This reality is reflected in the shape of New Zealand's multi-track trade policy and the seriousness with which it has been pursued by successive governments. At the time of the Uruguay Round this policy had four main tracks—domestic or unilateral, bilateral, regional, and multilateral—all directed in pursuit of the first-best policy outcome, complete multilateral free trade.[9]

An extensive programme of domestic economic reform, including liberalization at the border and internal deregulation, was undertaken in New Zealand's self-interest beginning in the early 1980s and continuing through to the late 1990s. The resulting policy settings, which in many areas remain considerably ahead of bindings in the WTO, allowed the government at that point to determine that New Zealand was sufficiently internationally competitive that further liberalization could be pursued primarily on a reciprocal basis.[10] Thus multilaterally in the WTO, regionally in APEC, and bilaterally, New Zealand is prepared to liberalize its remaining barriers to trade on a legally binding basis provided that trading partners are prepared to do the same.

Liberalization opportunities in the bilateral/regional and multilateral contexts are explored in Parts IV and V of this chapter respectively, building on the baseline established by the Uruguay Round as summarized in Part III below.

III. New Zealand's Participation in the Uruguay Round

Reflecting the economic realities described above, New Zealand was an active proponent of and participant in the Uruguay Round with the principal goal of liberalising trade in agriculture. This reflected the failure of the GATT, in previous negotiations, to deal seriously with agricultural trade barriers. In part because of this failure, New Zealand had to that point not been particularly forthcoming in its own GATT commitments. The domestic economic reform of the 1980s and 1990s, however, positioned New Zealand

[8] *See, e.g.*, Philippa Dee, Chris Geisler, and Greg Watts, *The Impact of APEC's Free Trade Commitment*, Staff Information Paper, Industry Commission of Australia (1996).

[9] For a complete exposition of this policy *see New Zealand Trade Policy; Implementation and Directions: a Multi-Track Approach*. New Zealand Ministry of Foreign Affairs and Trade, September 1993.

[10] New Zealand's applied MFN tariff rates were frozen at their July 1999 rates until July 1, 2005. A review is currently underway, to be completed in 2003, to determine the shape of the post-2005 tariff regime.

to take a strong pro-liberalization stance across the board in the Uruguay Round as the best strategy to promote significant liberalization of agricultural trade.

In agriculture New Zealand sought to bring the sector firmly within the scope of the rules applying to other products and to secure significant market opening and reduction of subsidisation, both domestically in major producing countries and in export markets. New Zealand was also a proponent of enhanced market access for industrial products and of bringing services trade and intellectual property under multilateral disciplines. Related to this was the need to guard against the protectionist imposition of offsetting non-tariff barriers through negotiation of disciplines on both sanitary and phytosanitary measures and on technical barriers to trade. New Zealand also sought to negotiate improvements to the GATT's dispute settlement system so that agreements once negotiated could be more effectively enforced. Finally in the knowledge that outcomes in most areas were likely to be partial at best, New Zealand sought to provide a platform for further negotiations.

The results of the Round for New Zealand were described in detail in a series of publications produced by the Ministry of Foreign Affairs and Trade following conclusion of the negotiations.[11]

Reflecting the partial nature of the outcomes, the economic gains were relatively modest. Conservative estimates suggested a total increase of 2–3 percent in GDP phased in over the course of the decade from 1995–2004 as a result of Uruguay Round implementation. In 1994 dollar terms this equated to between NZ$1.5 billion and NZ$2.3 billion, the equivalent of between 20,000 and 30,000 jobs or between 2 and 3 percent of the then workforce.[12]

The farm sector was considered to be a major beneficiary with increased market access and lower tariffs forecast to boost sector revenue by NZ$1.0 billion to NZ$1.5 billion over the same period. A study undertaken by the Ministry of Foreign Affairs in 2002 indicated that duties paid on New Zealand exports were NZ$525 million lower in 2000 than they would have been without the tariff cuts resulting from the Uruguay Round. This includes almost NZ$400 million of duty savings on agricultural exports, with the meat and dairy sectors saving approximately NZ$190 million and NZ$130 million respectively. Significant results in individual markets were NZ$90 million saved on exports to the EU, mainly as a result of zero tariffs on in-quota exports of sheepmeat; and NZ$70 million in savings on in-quota exports of beef to the United States. In aggregate these duty savings translate into an additional NZ$11,500 of income for every sheep, beef and dairy farmer in New Zealand.[13]

Gains also resulted from tariff cuts on industrial products and from commitments secured on New Zealand services exports. Considerable scope for further progress remains, however. Despite the Uruguay Round tariff cuts, import duties paid on New Zealand's exports amounted to NZ$884 million on a total of NZ$17.06 billion of exports to WTO founding nations, an average duty rate of approximately 5.2 percent. Of this NZ$751 million was paid on agricultural exports at an average rate of 7.2 percent.[14]

The other major gain for New Zealand from the Uruguay Round was the improvements made to the dispute settlement system. For a small country with limited bilateral

[13] Results published in QUESTIONS FOR A TRADING NATION, New Zealand Ministry of Foreign Affairs and Trade, 2002.

[14] *Id.* This average duty paid figure does not account for the trade chilling effect of prohibitively high tariff rates in many of New Zealand's potential export markets.

leverage, the existence of a rules-based trading system is key. But the rules of the system are only as good as members' compliance with them. The usefulness of the GATT dispute settlement system was limited by the fact that redress was subject to veto by the defending party. The Uruguay Round removed that unilateral power of veto, replacing it with a two-stage process. Once judgement is rendered through that process, it automatically applies unless overturned by consensus; in other words the complaining party now effectively holds the veto.

New Zealand has three times successfully used the WTO dispute settlement system to secure removal of measures, found to be WTO-illegal, imposed by the European Union on New Zealand "spreadable" butter,[15] by the United States on New Zealand lamb,[16] and, together with the United States, by Canada on exports of dairy products in contravention of its commitments on dairy export subsidies.[17] At the time of writing (May 2003), New Zealand, along with eight co-complainants, was involved in a dispute with the United States concerning safeguard measures on steel.[18]

New Zealand has also been involved in a number of disputes as a Third Party. To date, New Zealand has not been the subject of any dispute settlement proceedings under the WTO.

IV. Regional and Bilateral Trade Liberalization

New Zealand has long taken a twin-track approach to regional ("RTA") and bilateral ("FTA") trading arrangements: it has supported "genuine" arrangements, and been active in looking to conclude such arrangements; and it has sought to constrain "partial" arrangements.

[15] *European Communities—Measures Affecting Butter Products*, WT/DS72. Consultations were requested in March 1997 and a Panel established in November 1997. New Zealand requested suspension of the panel proceedings in February 1999 and in November 1999 notified the Dispute Settlement Body that a mutually agreed solution had been reached.

[16] *United States—Safeguard Measures on Imports of Fresh, Chilled and Frozen Lamb from New Zealand,* WT/DS177. Consultations were requested in July 1999 and a panel requested, together with Australia, in October 1999. The Panel found against the United States in December 2000 and, following an appeal by the United States, the Appellate Body upheld that finding in May 2001. The United States removed the measures as of November 15, 2001.

[17] *Canada—Measures Affecting Importation of Milk and Exportation of Dairy Products*, WT/DS113. Consultations were requested in December 1997 and a panel requested in March 1998. New Zealand's request was joined with that of the United States (WT/DS103). The Panel found against Canada in May 1999 and, following an appeal by Canada, the Appellate Body upheld the finding in October 1999. In implementing the findings Canada introduced new measures on a province-by-province basis. New Zealand and the United States requested Article 21.5 consultations concerning those measures in February 2001 which led to the reconvening of the Panel to consider the measures concerned. The Panel again found against Canada in July 2001, a result which Canada again appealed. The Appellate Body in December 2001 declined to rule on the consistency of the measures in question arguing it was unable to complete analysis of claims made by New Zealand under Articles 9.1(c) and 10.1 of the Agreement on Agriculture. New Zealand sought recourse again to Article 21.5 of the Dispute Settlement Understanding with the panel again finding against Canada in July 2002. Following a further appeal by Canada, the Appellate Body upheld the finding in December 2002. Canada and New Zealand notified a mutually agreed solution to the dispute in May 2003.

[18] *United States—Definitive Safeguard Measures on Imports of Certain Steel Products*, WT/DS258. Consultations were requested in May 2002 and a panel established in July 2002. The Panel, which requested an extension of its work until April 2003, issued its interim findings in late March. These remained confidential to the parties at the time of writing but were widely reported in the media as being against the U.S. measures. Co-complainants are Brazil, China, Chinese Taipei, European Communities, Japan, Korea, Norway and Switzerland.

"Genuine" and "partial" are not intended here as subjective terms, although inevitably a degree of subjectivity is involved. Rather they refer to an assessment of whether the preferential liberalization is likely to have a positive or detrimental effect on the dynamic for liberalization more broadly, and ultimately on the multilateral trading system.

The economist's answer to this question would involve an analysis of whether any particular agreement was primarily trade-creating (adding to overall trade) or trade-diverting (with increased trade inside the preferential arrangement substituting for more efficient exchange with third parties). Just as the "fundamentals" tended to be out of favor in the financial markets for much of the 1990s, it is momentum theory that currently seems to be the vogue in thinking about preferential trading arrangements. Thus well-designed arrangements that drive liberalization further and faster than is possible in broader contexts are seen as having the potential to serve as "building blocks", establishing benchmarks and creating momentum for liberalization efforts more broadly. Conversely partial "arrangements of convenience" which leave aside the more difficult or sensitive sectors or issues can make it more difficult for countries to engage in broader fora and can act as "stumbling blocks," undermining the key principle of most favoured nation ("MFN") non-discrimination.

Accordingly, New Zealand is open to explore options for RTAs/FTAs with any of its significant trading partners on the basis that such arrangements are: outward looking—in the sense of not introducing additional preferences against third countries; open-ended—in the sense of being open to accession by others; reform-friendly—in the sense of not blocking unilateral reform by either party; and comprehensive—in the sense of encompassing all products and all barriers to trade. New Zealand has also sought to ensure its agreements are "Asia-Pacific friendly"—in the sense of contributing towards the achievement of APEC goals; timeframe and comprehensiveness are key components of this.[19] Pursuant to this policy, New Zealand is a member of a number of the better-designed arrangements in existence.

A. Regional Liberalization—APEC

The broadest of these is the Asia Pacific Economic Cooperation ("APEC") forum. For the moment APEC cannot be described as an RTA as such, but it has established the most far-reaching liberalization objectives in existence.[20] These are the so-called "Bogor Goals" agreed in Bogor, Indonesia in 1994, under which all 21 APEC member economies are committed to the achievement of free and open trade and investment no later than 2010 in the case of industrialized economy members and no later than 2020 in the case of developing economy members.[21]

[19] *See* NEW ZEALAND TRADE POLICY 1993.

[20] APEC qualifies ahead of the EU by virtue of relative size, with APEC member economies comprising over 41 percent of the world's population, 60 percent of global GDP (around 55 percent on a purchasing power parity (PPP) basis) and 48 percent of world trade; in comparison with approximately 6, 25 (20 on a PPP basis) and 36 percent respectively for the fifteen-member EU. With the ten new members admitted at the end of 2002, the newly formed EU comprises a little over seven percent of global population and just under thirty percent of global GDP. *See UN Social Indicators Report* at www.unstats.un.org; *UNCTAD Statistics in Brief: International Trade; Value of Exports and Imports of Goods in 2001* at www.UNCTAD.org; and *World Bank Development Indicators Database 2002* at www.Worldbank.org.

[21] Members who have joined after 1994 are similarly pledged through continual reiteration of their commitment by their political leaders, for instance at Auckland, New Zealand in 1999 which saw the most recent admission of members: Peru, Russia and Vietnam.

APEC members are still trying to work out exactly how they will achieve this goal. Establishment of the goal was followed in 1995, in Osaka, Japan by the scoping out of an "Action Agenda" and then in 1996 in Manilla, Philippines by the setting of an initial "Plan of Action". Notably the Osaka Action Agenda reinforced the truly comprehensive nature of the goals which addresses all barriers to the movement of all goods, services and capital—*"The APEC liberalization and facilitation process will be comprehensive, addressing all impediments to achieving the long term goal of free and open trade and investment"*—no room for ambiguity there.[22] The Manilla Action Plan determined that some areas of work would be pursued individually, others collectively. "Concerted unilateral liberalization" was agreed as the overall unifying modality of how APEC members would move forward, each at their own pace, to arrive jointly at the commonly agreed goal.

The APEC lexicon tended to be confused somewhat by the Early Voluntary Sectoral Liberalization ("EVSL") exercise which began in Vancouver, Canada in 1997 and ended in Auckland, New Zealand in 1999, to voluntarily accelerate the Bogor Goal of tariff elimination in selected sectors.[23] Note that agreement to voluntarily curtail some of the timetabling flexibility available to economies under the Bogor Goals, which permitted them to take up to 2010/2020 to eliminate tariffs, should not be confused with the need to eliminate tariffs at that point. The latter is action which is now required to fulfil a solemn commitment voluntarily entered into at Bogor and reiterated by Leaders and Ministers ever since.[24]

With hindsight EVSL was always doomed to failure within APEC because the sectors chosen, while extensive, did not sufficiently encompass the export interests of all APEC members to allow the deal to be self-balancing, and because some APEC members were unable to liberalize these sectors on an MFN basis solely within the APEC context. Given that preferential liberalization on a partial sectoral basis could never be considered to be consistent with WTO rules, the EVSL package could only have been agreed and implemented through the participation of a "critical mass" of WTO members willing to bind the results in their WTO tariff schedules. Indeed, in the run-up to the Seattle WTO Ministerial, APEC WTO members sought to advance a renamed Accelerated Tariff Liberalization ("ATL") initiative for accelerated WTO liberalization in the nine priority EVSL sectors. The results were to have been applied on a provisional basis pending the results of broader WTO tariff negotiations.[25]

Arguably APEC members could have more profitably used the 1997–99 period to engage in a "virtual" negotiation to draw up detailed economy schedules of how they

[22] "Comprehensiveness" principle of the Osaka Action Agenda; from the APEC Economic Leaders' Meeting at Osaka, Japan 1995. *See* www.apec.org.

[23] EVSL covered fifteen sectors. Nine sectors—chemicals, environmental goods and services, energy, fish and fish products, forest products, gems and jewellery, medical equipment and instruments, telecommunications (mutual recognition agreement), and toys—were identified for priority liberalization; with the other six sectors—automotive, civil aircraft, fertilizers, food, natural and synthetic rubber, and oilseeds and oilseeds products—to be considered subsequently. Together the fifteen sectors comprise more than forty percent of merchandize goods trade.

[24] The section of the Osaka Action Agenda that deals with tariffs speaks of achieving free and open trade by "progressively reducing tariffs". It is unlikely the drafters envisaged a requirement for negative tariffs (subsidisation of imports). It can therefore be safely assumed that when tariffs reach zero the Bogor goal, with respect to tariffs, will have been achieved and progressive reduction can be stopped.

[25] *See Strengthening the Foundations for Growth*, APEC Economic Leaders Meeting, Kuala Lumpur, Malaysia, November 1998; and *The Auckland Challenge*, APEC Economic Leaders Meeting, Auckland, New Zealand, September 1999.

would implement the Bogor Goals across the board.[26] The resulting draft tariff, services, and other schedules could then have been taken to the WTO Ministerial in Seattle with the challenge that APEC WTO members would bind them in place if a critical mass of other WTO members would reciprocate. If other WTO members were not prepared to take up that challenge, APEC members would have proceeded to implement free and open trade and investment among themselves on a preferential basis according to the agreed schedules.

Of course it is not possible to rewrite history in this way. As noted in Part IV(B) below, however, this option remains open to APEC as a whole or to an alternative group of countries, both within and beyond APEC, determined to lead the way towards genuine free trade at the multilateral level.

A considerable amount of progress has been made toward achievement of the Bogor Goals, well beyond the implementation of WTO commitments arising from the Uruguay Round (for those APEC members which have such commitments), but much more remains to be done.

While many APEC economies continue to unilaterally liberalize areas of economic activity in their own self-interest, it is increasingly clear that concerted unilateral liberalization alone will not be sufficient for APEC to realise the Bogor Goals. In 1999 APEC made a concerted effort to enlist the support of the multilateral trading system through, unsuccessfully, sponsoring the launch of a WTO Round at Seattle. This was achieved in November 2001 at Doha, but two years of the APEC timetable have been lost. In Auckland in 1999 APEC Leaders agreed that:

> Support for ongoing WTO negotiations will remain a key area of APEC's work throughout the negotiations. In particular, we resolve to work actively in the negotiations to ensure that APEC and the WTO are mutually reinforcing . . . to avoid fragmentation of the international trading system, we need to ensure convergence between regional and multilateral liberalization initiatives.[27]

Looking at the Bogor Goals, this effectively means that APEC economies in the WTO need to work to promote the achievement of free and open trade and investment globally, and in a timeframe which roughly accords with that of Bogor.

B. Bilateral Liberalization—FTAs

Just as APEC and the WTO have the potential to be mutually reinforcing, so too do APEC and sub-APEC liberalization efforts. New Zealand is also active at this level.

Under the CER (Closer Economic Relations) agreement with Australia, New Zealand has had a comprehensive free trade agreement with its largest economic partner since the early 1980s. Full free trade in goods was achieved in 1990 and under the negative list approach on services, introduced in 1988, virtually all of the initially excluded service sectors or sub-sectors have been brought under full coverage of the agreement.[28] With the exception of investment where national policies continue to prevail,[29] Australia and

[26] Such an exercise could have been presented as an intensification, in the degree of detail and depth of coordination, of APEC's "Individual Action Plan" process.

[27] *The Auckland Challenge*; APEC Economic Leaders' Meeting, Auckland, New Zealand, September 1999. *See* www.apec.org.

[28] New Zealand retains only two sectoral limitations: air services and coastal shipping. Australia retains six: air services, broadcasting and television, third party insurance, postal services, and coastal shipping.

[29] New Zealand and Australia both have screening systems that apply to approval of foreign direct investment in certain types of assets (in New Zealand's case this relates mostly to land) and above certain monetary

New Zealand are effectively a single market of over 22 million people with a combined CER economy of US$500bn. A joint food standards authority has been established, anti-dumping has been replaced by mutual application of competition policy, there is mutual recognition of product standards and professional qualifications, essentially free movement of people, and the beginning of business law harmonization.

CER was signed in 1983 and two-way trade has grown every year since at compounding rates of up to twelve percent. As a result bilateral trade in goods has doubled in real terms. In nominal terms, between 1980 and 2000 the value of New Zealand exports to Australia grew by 859 percent from NZ$643 million to NZ$6.08 billion. This increase was 66 percent faster than New Zealand's exports to the rest of the world which grew by just over 500 percent in that time. During the same period Australia's exports to New Zealand grew by 641 percent from $945 million to $7.01 billion.[30]

Both New Zealand and Australia have carried this model of comprehensive liberalization into other bilateral and sub-regional initiatives in which they have engaged. Jointly there is an ongoing dialogue with the economies of the ASEAN Free Trade Area ("AFTA") with the objective of merging the two free trade areas. With CER and AFTA of roughly equal economic size, a combined FTA would encompass US$1 trillion in economic activity giving the region a significant degree of critical mass in broader negotiations.

New Zealand and Singapore concluded a comprehensive FTA in 2000—the first for Singapore. This entered into force on January 1, 2001 with completely free trade in goods and comprehensive free trade in services envisaged according to the 2010 Bogor timeframe. Singapore subsequently entered into negotiations with Australia and the United States.[31] New Zealand has also commenced negotiations with Hong Kong, again a world first; and at the 2002 APEC Leaders' Meeting at Los Cabos Mexico, New Zealand and Singapore jointly announced three-way negotiations with Chile, an innovative approach to link economies across three corners of the Asia-Pacific region.

Australia and New Zealand both are seeking to negotiate free trade with the United States. On November 13, 2002, United States Trade Representative Ambassador Zoellick notified the U.S. Congress of the Bush Administration's intention to initiate negotiations with Australia and to solicit the views of Congress on New Zealand's interest to also negotiate an FTA with the United States.

Whether such negotiations are concluded in parallel or separately remains to be seen. But what is important is that the United States does not seek to conclude an FTA with only one part of the CER single market. FTAs between the United States and both Australia and New Zealand would clearly be in the interests of all three countries. Conversely the United States concluding an agreement with one CER partner but not the other would be economically damaging.

C. Encouraging the "Competitive Liberalization" Dynamic

U.S. negotiations with both Australia and New Zealand, on top of those it has with Singapore (and Chile) would be a significant indication of U.S. interest to engage with

thresholds. Under a recent review of CER these thresholds were increased, in New Zealand's case from NZ$10m to NZ$50m, with the increase applying to investment from all sources rather than just under CER.

[30] Figures sourced from Statistics New Zealand.

[31] Australia and Singapore announced agreement in their negotiations in October 2002. The United States and Singapore announced they had reached "substantive agreement" in November 2002, with the resulting agreement being signed by President Bush and Prime Minister Goh on May 6, 2003. The agreement remains to be approved by the U.S. Congress.

the economies of the Western Pacific to make the Bogor Goals a reality. Such agreements would act as a powerful magnet for other economies in the region. Several of the other ASEAN economies could be expected to want to join in; Thailand for instance, is already showing interest.[32] In North East Asia, Chinese Taipei[33] needs little encouragement, Korea would have a strong incentive to join, and China too could be expected to show interest. At some point in that process, fear of exclusion would compel Japan to engage seriously.

FTAs between Australia, New Zealand and the United States, three of the world's most efficient agricultural producers/exporters, would also represent an ideal opportunity to establish the model of how agriculture should be dealt with in trade agreements.[34] This is significant because with agriculture among the most heavily protected sectors in many economies, particularly in North East Asia, the majority of the "partial" FTAs involve some degree of exclusion of agriculture.[35] In the short term this exclusion might be considered to be to the advantage of efficient third-party agricultural exporters as it avoids potential trade diversion resulting from any preferential access opportunities. In the long run, however, if countries are free to liberalize only those sectors they find convenient, their incentive to engage in broader liberalization processes such as the WTO, where they have to deal with the difficult sectors, is much reduced. Markets remain closed.

The WTO, through GATT Article XXIV on the goods side and GATS Article V on services, does contain provisions designed to minimize the negative impact of preferential trading arrangements on the multilateral trading system. To date, however, the effectiveness of these provisions in constraining members' behavior has been rather mixed. In part this is because of the vagueness of terminology such as the requirement that agreements eliminate duties and other trade restrictions on "substantially all trade".[36] But, as the incidence of sub-optimal preferential agreements spreads, it also reflects a general reluctance to be throwing stones in one's own glasshouse.

The limitations of a containment approach in the current environment suggest that engagement is likely to be a more effective strategy. This entails setting out an alternative competing paradigm in the FTA marketplace. This is what New Zealand has been seeking to do in advancing the truly comprehensive model inherent in the architecture of APEC's Bogor Goals. For a country the size of New Zealand to adopt this approach is one thing. But with some of the world's largest traders on the other side of the argument, the engagement strategy needs a champion of significance if it is to succeed.

The United States is by far the best (and perhaps the only) candidate for this. Only by being prepared to fully engage domestically in a truly comprehensive approach to

[32] Thailand is already in FTA negotiations with Australia and is looking to commence negotiations with the United States. At the APEC Economic Leaders' Meeting in Los Cabos Mexico, the United States announced an "Enterprize for ASEAN Initiative". This provides a pathway towards FTA negotiations for ASEAN member countries. Under the pathway, FTA aspirant countries have to be WTO Members, have a Trade and Investment Framework Agreement ("TIFA") with the United States and be ready to open their economy. Currently Indonesia, the Philippines and Thailand have TIFAs.

[33] The WTO and APEC terminology for Taiwan.

[34] Given the extent of subsidization in agriculture, both in domestic support and export subsidies, the primary focus of a bilateral or regional FTA would have to be on market access. Countervailing duty provisions could be used to protect domestic producers from any highly subsidized competitors within such an agreement. Provisions on non-use of export subsidies within an FTA/RTA have also been contemplated.

[35] This is a feature of many of the agreements concluded by the European Union. It is noticeable that the recently concluded agreement between Japan and Singapore, while covering a relatively high proportion of actual trade, reportedly covers less than eighty percent of tariff lines with the bulk of the exclusions being in agriculture.

[36] *See* GATT Article XXIV:8(a)(i).

liberalization, and then using the power of its market to insist on such an approach being adopted by any of its trading partners who want enhanced market access, can the United States really deliver the "competitive liberalization" dynamic, that U.S. Trade Representative Zoellick advocates, to the benefit of all sectors of the U.S. economy. Ambassador Zoellick is reported as saying: "If you want to negotiate with the U.S. to open markets, we'll negotiate."[37]

If the United States was prepared to champion such an approach, it could quickly become the reality, at least amongst those thirty to forty countries that make up the middle echelon of the world economy and the global trading system. This in turn would energize the WTO as the forum in which the competing market access paradigms between the United States and the EU and Japan, together with the associated rules issues such as disciplines on subsidization, were resolved.

V. Multilateral Liberalization—The Doha Round

New Zealand was among those countries most strongly and consistently advocating the launch of a new round of multilateral trade negotiations. The failure of Ministers to do so at Seattle was a severe disappointment, especially given the energies devoted through the APEC process that year in support of a Round launch. In contrast, the successful launch of negotiations at Doha was regarded by New Zealand as a major achievement. New Zealand played an active part in promoting that result and has since sought to be in the vanguard of those looking to advance an ambitious outcome to the Round.

New Zealand's core interests in the Doha Round were set out in a July 2001 Cabinet paper.[38] These largely flow from the unfinished business of the Uruguay Round and center on further liberalization in agriculture, non-agricultural products (in particular fish and forestry) and services, together with strengthened rules to ensure the effectiveness of negotiated market access and better integration of the work of the WTO with other priority areas of international policy. These negotiating objectives are pursued from a sustainable development perspective and in consultation with stakeholders including business, trade unions, Maori and non-governmental organizations. The sections below examine how New Zealand is looking to progress these objectives in relevant areas of the negotiations.

A. Agriculture

As will be evident from the description of the Uruguay Round outcomes in Part III above, New Zealand's principal focus in the Doha Round is achieving significant further liberalization of agricultural trade.

New Zealand has three main aims in the Doha Round agriculture negotiations: to secure elimination of all export subsidies as soon as possible; to secure significant increases in market access for its agricultural exports, including substantial lowering of tariffs, increases in quantity and quality of access for products covered by tariff quotas, and removal of unnecessary non-tariff barriers; and to secure progressive reductions in, and eventual elimination of, trade-distorting domestic subsidies.

[37] *A Free-Trade Gamble by the U.S.*, WASHINGTON POST, March 29, 2002, pp. E1 and E2.

[38] *See* www.mfat.govt.nz/foreign/tnd/wtonegotiations/cabinet.html. Material in this section draws heavily from this and related issue papers.

These objectives are pursued through membership of the Cairns Group, a group of seventeen countries which together comprise one-third of the world's agricultural exports and which is dedicated to the pursuit of "fair trade" in agricultural products.[39] The Cairns Group has made proposals in each of these three key areas of the negotiations: market access, export competition and domestic support.[40]

On export competition the Cairns Group has proposed the elimination of all forms of export subsidization.[41] Following a fifty percent downpayment cut in the first year of implementation, elimination would be achieved over three years by developed countries and over six years by developing countries. Enhanced disciplines are also proposed on export credits and non-emergency food aid. In addition the Group has advocated improved disciplines on export restrictions and taxes.

The Cairns Group has also called for substantial improvements in agricultural market access.[42] Proposals include the reduction of all developed country tariffs to a maximum of 25 percent or lower, and expansion of developed country tariff quota access by the equivalent of 20 percent of domestic consumption with improved tariff quota administration. Special and differential treatment would be granted to developing countries through requiring a lower tariff reduction—including a maximum 50 percent reduction for all tariffs less than 250 percent, and a lower tariff quota expansion—equivalent to 14 percent of domestic consumption.

For developed countries these changes would be effected over five years with a fifty percent downpayment in the first year of implementation. Developing countries would have nine years to make the required changes. The current special safeguard mechanism would be eliminated for developed countries with developing countries permitted to employ a new targeted additional duty mechanism to deal with subsidized product from developed countries.

On domestic support the Cairns Group has advocated major reductions leading to elimination of all forms of trade a production distorting support, including AMS and "blue box" measures.[43] Specifically the proposals call for the reduction, on a product-specific basis, of bound AMS levels to zero over five years for developed countries and nine years for developing countries, with a fifty percent downpayment by developed countries in the first year of implementation. In addition the "blue box" exemption would be eliminated as would the *de-minimus* provision for developed countries. Developing countries would retain existing de-minimus provisions and least developed countries would be exempt from all reduction commitments. In respect of the "green box" the Cairns Group has proposed a tightening of criteria to ensure that covered measures have no, or at least minimal, trade distorting effects. An overall cap on "green box" expenditure is proposed with enhanced capability for developing countries to maintain measures for food security, rural development and poverty alleviation.

In addition to the proposals advanced by the Cairns Group, New Zealand for its part would have no difficulty signing up to the "triple zero" future for agriculture envisaged by

[39] The Cairns Group comprises Argentina, Australia, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Guatemala, Indonesia, Malaysia, New Zealand, Paraguay, Philippines, South Africa, Thailand and Uruguay.
[40] Full details of all proposals can be found at www.cairnsgroup.org.
[41] *See* G/AG/NG/W/11 of June 16, 2000 and additional input of November 20, 2002. G/AG/NG/W/54 of December 21, 2000 deals with export restrictions and taxes.
[42] *See* G/AG/NG/W/54 of November 10, 2000, Job(02)112 of September 12, 2002, and additional input of November 20, 2002.
[43] *See* G/AG/NG/W/35 of 22 September 2000 and document 7623 of September 27, 2002. In Job(02)209 of December 11, 2002 New Zealand provided further technical elaboration on disaggregation and base periods.

the United States:[44] zero export subsidies; zero tariffs; and zero trade-distorting domestic support.

Outside these three core areas of the negotiation, some countries are seeking to advance a variety of "non-trade concerns" including food security, food safety, animal welfare, regional development, environmental aspects of agriculture, and food geographical indications. Ministers at Doha confirmed that non-trade concerns would be "taken into account" in the negotiations as provided for in the Agreement on Agriculture.[45] New Zealand acknowledges the significance of such "non-trade concerns" but in turn is concerned to ensure they are not used as a means of disguised protectionism. It is clear that many of the concerns advanced can be addressed in ways that do not distort trade.

B. Non-agricultural Products

New Zealand is also concerned to secure the maximum possible improvement in market access and trading conditions for all non-agricultural products.

From the exporting perspective, tariffs on New Zealand non-agricultural exports amount NZ$185m annually. Exporters also frequently face significant tariff escalation, particularly in the fish and forestry industries.

On the importing side, New Zealand is again somewhat atypical of OECD countries. Applied rates are generally low with an average of less than four percent and over ninety percent of imports entering duty free. Tariff peaks in textiles, clothing and footwear range up to nineteen percent ad-valorem (with some alternative specific duties that translate to a higher ad-valorem equivalent on low-value articles), but at an average of seven percent bound tariffs on agriculture are lower than the average bound rate on industrial products of thirteen percent. Since 2001 New Zealand has provided complete duty-free access for all products from the 48 least developed countries, the first country to do so.

Key issues for New Zealand in the negotiation include comprehensiveness—ensuring that all products are included in the negotiation; achieving greater security of access through securing bindings on all tariff lines and which better reflect applied rates—currently only 72 percent of tariffs in developing countries are bound with many bindings at "ceiling" rates; and addressing tariff peaks (very high tariffs), tariff escalation (where tariffs rise as value-added increases) and nuisance tariffs—low tariffs that serve no protective purpose but give rise to unnecessary "red-tape" costs for exporters.

In pursuit of these objectives New Zealand in November 2002 called for the elimination of all non-agricultural tariffs by all WTO members other than the least developed countries.[46] A detailed proposal has yet to be submitted but it is envisaged that all WTO members, other than least developed members, would be required to bind all non-agricultural tariffs at zero by an agreed date. Extended timeframes could be provided for sensitive products and for less developed members. Least developed members could participate on a voluntary basis.

[44] The text of the July 2002 United States proposal on agriculture can be found at www.fas.usda.gov/itp/wto.actual.htm. An overview of the proposal together with related commentary can be found at www.fas.usda.gov/itp/wto.proposal.htm. Phase 2 of the proposal spells out the "triple zero" future for agricultural trade.

[46] Statement by New Zealand at the meeting of the Negotiating Group on Non-agricultural Market Access, November 3–4, 2002.

C. Services

As noted in Part I, services play an important role in the New Zealand economy comprising more that seventy percent of GDP and almost one-quarter of total exports. Following extensive deregulation and reform throughout the 1980s and 1990s, as with the goods economy, very little residual protectionism remains.

New Zealand is therefore interested in promoting further services liberalization both through deepening of Members' existing commitments and expansion of the scope of commitments by other Members to match the extent of commitments made by New Zealand in the Uruguay Round. These and other objectives for the services negotiations, including the agreeing of enhanced disciplines on domestic regulation under GATS Article VI targeted specifically at potential barriers to trade in services, were outlined in a communication tabled by New Zealand in July 2001.[47]

In addition to making bilateral requests of certain WTO members, New Zealand has also submitted specific negotiating proposals in the areas of education services, air transport services, construction and related engineering services, consulting services, postal and courier services, and sporting services.[48]

New Zealand was also one of those WTO members to submit, in accordance with the established March 31 deadline, an initial offer of further liberalization commitments it is conditionally prepared to make.[49] The offer includes improved commitments in existing sectors included in New Zealand's GATS schedule such as air transport, computer services, construction, engineering, financial services, maritime transport services, and telecommunications. Commitments are also offered in a range of additional sectors including credit reporting and collection agency services, environmental consulting services, integrated engineering, management consulting and postal and courier services. New Zealand has also offered to enhance its horizontal commitments on "Mode 4" movement of persons and to remove two of its five MFN exemptions.[50]

Reflecting the liberalization that has occurred in the New Zealand postal sector, the offer in that sector provides for open access to supply the full range of postal services in New Zealand. This is conditional on others responding to reciprocal New Zealand requests in the sector and caveated by the right to take action against foreign monopoly providers.

As with a number of other countries, a range of services in New Zealand such as health, education, social welfare and water distribution are either wholly or in substantial part funded and supplied publicly. New Zealand has therefore made it clear that in submitting its initial offer it was not limiting the government's right to provide, fund or regulate such services.

D. Rules

In addition to seeking improved market access for exported goods and services, New Zealand is also interested to pursue improvements to WTO trade rules to ensure, through

[47] *See* S/CSS/W/90, *Objectives for Renewed Services Negotiations*, Communication by New Zealand, July 26, 2001.

[48] *See* respectively S/CSS/W/93, S/CSS/W/92, S/CSS/W/91, S/CSS/W/116, S/CSS/W115 and S/CSS/W94. These and other sectoral proposals made in the services negotiations can be found on the WTO website at www.wto.org/english/tratop_ e/serv_ e/s_ propnewnegs_ e.htm.

[49] New Zealand's initial offer (S/CSS/W/NZL) can be found on the Ministry of Foreign Affairs and Trade website at www.mfat.govt.nz/foreign/tnd/wtonegotiations/stagetwoservices/GATS initial conditional offer2.pdf.

[50] New Zealand's existing schedule of specific commitments on services is contained in GATS/SC/62 plus Supp.1 and Supp.2. Current MFN exemptions are listed in GATS/EL/62.

agreed disciplines on anti-competitive and trade protectionist behavior, that commitments made provide for effective market access.

In the area of anti-dumping New Zealand both applies anti-dumping remedies and is subject to anti-dumping orders imposed on exporters in overseas markets. New Zealand is careful to ensure that any anti-dumping actions it takes address real instances of injury caused by dumping. While wishing to retain the ability to take such action, it is therefore also concerned to see that the Anti-Dumping Agreement provides sufficient discipline to guard against New Zealand exporters being faced with measures imposed for other than that reason.

On subsidies New Zealand recognizes that in controlled circumstances subsidies may assist economic development. At the same time there is concern to constrain subsidies granted by other Members that undermine the competitiveness of New Zealand exports.

New Zealand is therefore interested to maintain the "traffic-light" structure of the Agreement on Subsidies and Countervailing Measures—red (prohibited); orange (actionable); and green (non-actionable). Following the lapsing in 1999 of the parts of the agreement that had been applied provisionally,[51] negotiations could usefully reintroduce some "teeth" into the serious prejudice provisions of Article 6 and reinstate some forms of non-actionable subsidies under Article 8.

New Zealand is also a member of the "Friends of Fish" group[52] seeking enhanced disciplines on subsidies in the fisheries sector. Fisheries subsidies are estimated at between US$14bn and US$20bn or some 20–25 percent of global production value, and twice that as a proportion of the value of fish traded internationally. It is estimated that the catch capacity of the global fishing industry is around thirty percent greater than required for sustainable catch levels. Subsidies have been implicated in stimulating this over-fishing.

Communications by members of the Friends of Fish group and separately by New Zealand have sought to identify some of the limitations of current subsidies disciplines in dealing with the particular characteristics of the fisheries sector.[53] With the major subsidizers also being major consumers and thus not significant exporters, the countervailing duty mechanism can exert little discipline on subsidizing behavior. That points in the direction of "serious prejudice" as the main potential constraint, but the heterogeneous nature of fisheries products—whereby products from distinct species can be in direct competition in a market while superficially similar fish from the same family can command distinct prices—means that unsubsidized reference prices are not generally available.

The objective of improved disciplines would be to significantly reduce pressure on world fish stocks and enhance the sustainable economic value of fisheries resources. This would be a clear example of a "win-win" outcome for both the trading system and the environment in pursuit of sustainable development.

Among other rules issues are the so-called "Singapore issues": the relationship between trade and investment; the interaction between trade and competition policy; transparency in government procurement; and trade facilitation. New Zealand is not a demandeur on any of these issues.

[51] *See* Article 31, of the Agreement on Subsidies and Countervailing Measures.

[52] Australia, Chile, Ecuador, Iceland, New Zealand, Norway, Peru, Philippines and the United States.

[53] *See* TN/RL/W/3, *The Doha Mandate to Address Fisheries Subsidies: Issues*, Communication by Australia, Chile, Ecuador, Iceland, New Zealand, Peru, Philippines, and the United States; April 24, 2002; and *Fisheries Subsidies: Limitations of Existing Subsidy Disciplines*, Submission by New Zealand, July 4, 2002.

On investment and competition New Zealand has a more liberal and robust regime than most WTO members. The nature of discussion to date on both issues suggests that New Zealand could easily live with the likely consensus outcome to any negotiations undertaken pursuant to the modality decisions to be taken at the Cancun Ministerial.

On government procurement New Zealand has a fully transparent non-discriminatory regime based on a value-for-money criterion. Greater transparency in the practices of others would be useful for potential New Zealand suppliers, but New Zealand has stood aside from the current plurilateral WTO Agreement on Government Procurement because the highly prescriptive nature of its provisions would introduce costly bureaucratic inefficiencies to the New Zealand procurement environment.

On trade facilitation New Zealand favors the greatest simplification possible in bureaucracy associated with international trade. Costly and inefficient bureaucratic procedures, and the existence of corrupt officials, can be equally chilling of trade as the more visible forms of trade barriers. The WTO already contains a considerable range of provisions relevant to trade facilitation. In any further negotiations, New Zealand is looking for an approach that is enabling rather than prescriptive to allow for innovation rather than reinforcing institutional rigidities.

E. Sustainable Development

New Zealand is also interested to ensure that Doha Round outcomes reflect a sustainable development perspective and that legitimate interests of developing countries are taken into account.

A significant part of this would be achieved through the increased efficiency in resource allocation and utilisation and increased global prosperity resulting from enhanced disciplines on or elimination of current distortions in the international trading system. Beyond that contribution from the WTO's core agenda, New Zealand is also concerned to see greater integration between the trading system and enhancement of environmental and labor objectives.[54] This calls for complementarity in policy design and implementation.

In the area of the environment New Zealand is participating actively in the negotiations on the relationship between WTO rules and specific obligations in multilateral environmental agreements ("MEAs") to ensure the WTO continues to show proper respect for internationally agreed rules for the protection of the environment. New Zealand is also interested to promote greater coherence between MEAs and trade agreements, and greater cooperation between respective institutions.

At the same time, however, it is important to ensure that environmental standards and measures are not used for protectionist purposes. That implies, for instance, that governments should have the right to determine their own domestic environmental regulations where those measures concern only the environment in their own jurisdictions and do not breach internationally agreed rules on environment and trade; that environmental standards should focus on the objective being promoted rather than unnecessarily prescribe the method by which that objective is to be achieved; and that measures which discriminate between products and services on the basis of their national origin are not imposed.

In the area of labor New Zealand is interested to see labor standards better integrated with trade agreements in order to promote decent work and improve living standards

[54] *See Framework for Integrating Environmental Standards and Trade Agreements*; and *Framework for Integrating Labor Standards and Trade Agreements*, www.mfat.govt.nz/foreign/tnd/wtonegotiations/labourframework.html.

in member countries. The aim is to create opportunities for work in which minimum standards are protected and adequate income is generated within a framework which promotes social protection. At the same time developing countries should not be denied the legitimate competitive advantage of lower labor standards provided such advantage is not secured by deliberately neglecting fundamental labor principals.

In pursuing this approach, New Zealand seeks to avoid undermining the status of the International Labor organization ("ILO"). New Zealand therefore looks to the ILO's Fundamental Principles and Rights of Work as an appropriate basis for discussion of labor standards within the context of trade agreements, core principals of which are: freedom of association and the effective recognition of the right to collective bargaining; elimination of all forms of forced of compulsory labor; effective abolition of child labor: and elimination of discrimination in respect of employment and occupation. Member countries should be free to implement these principals according to their own laws and practices with dialogue and consensus preferred to penalties or sanctions to progress any issues that may emerge in implementation.

For developing countries liberalizing trade in areas of their comparative advantage, including agriculture and textiles, will create opportunities for sustainable development. In addition New Zealand supports consideration of "special and differential treatment" for less and least developed countries, for instance through longer timeframes in implementing liberalization commitments. A so-called "two-speed" WTO with differing norms and obligations, however, is unlikely to be to the benefit of developing countries. Given the degree and potential for economic linkages between developing countries, and their relative paucity of domestic resources, developing countries need to avoid the waste that results from the protectionist policy choices in which the larger industrialized countries have indulged. Rather it is important to ensure developing countries are provided with capacity-building assistance to allow them to take advantage of the growth and development opportunities that a successful Doha Round outcome should create.

VI. Conclusion 332

I. The History of Russia's GATT/WTO Accession Negotiations

The negotiations aimed at the creation of the International Trade Organization ("ITO") coincided with the growing political tension between the Soviet Union and the West which eventually led to the Cold War. The Soviet Union did not respond to the initial proposal to participate in the creation of the ITO due to the prevailing political situation,[1] despite the fact that the parties to the ITO negotiations, notably the United States, attempted to involve the Soviet Union in the negotiations. The attempt to include the Soviet Union in the market-oriented trading system was reflected in the draft ITO Charter prepared by the United States.[2] Due to the failure of the Soviet Union to respond, the merits of the Soviet participation were not formally discussed by the parties to the ITO negotiations.

The ITO never came into existence. The General Agreement on Tariffs and Trade ("GATT"), an interim trade agreement, established the rules that governed the multilateral trading system from 1947, until its successor, the WTO, came into being in 1995. The Soviet Union viewed the GATT with criticism during the GATT's first fifteen years of existence.[3] This unsympathetic stance coincided roughly with the Soviet Union's 1949 launch of the Council for Mutual Economic Assistance ("CMEA"), a socialist alternative to the GATT. The Soviet Union's "strongly critical" approach towards the GATT was gradually relaxed in the 1960s when some CMEA countries joined the GATT.[4] From an economic perspective, the Soviet Union had less need than other socialist countries to join the multilateral trading system as its main exports, energy and minerals, faced few international barriers. This influenced the Soviet Union's decision "not to accept the invitation to participate in the Tokyo Round of trade negotiations".[5]

After decades of isolation from the West, by the 1980s the centrally planned Soviet economy faced severe problems, including a massive misallocation of resources, and a number of large and inefficient industries wielding monopolistic power.[6] Administrative orders rather than commercial considerations dictated what enterprises were to produce. The agricultural sector, which was severely crippled in the course of collectivization in 1930s, never recovered. Exports of mineral resources, such as oil and gas, constituted eighty percent of the Soviet Union's exports.[7] Its deteriorating economic situation caused the Soviet Union to consider establishing a closer relationship with the multilateral trading system. From 1983, the Soviet Union made informal approaches to different GATT contracting parties seeking the possibility to join as an observer.[8] The reaction of the major industrial powers was largely negative. These informal approaches were followed in 1986 by the Soviet Union's official request for GATT observer status, with

[1] The Soviet Union voted initially in ECOSOS in favor of the creation of the ITO.

[2] This proposed U.S. draft of the ITO Charter contained the following provision: "Any Member establishing or maintaining a complete or substantially complete monopoly of its import trade shall promote the expansion of its foreign trade with the other Members in consonance with the purposes of the Charter." Suggested Charter for an International Trade Organization of the United Nations, U.S. Department of State, Pub. No. 2598, Com. Policy Ser. No. 93 (1946).

its goal being accession to the GATT as a contracting party and eventual participation in the Uruguay Round launched in September 1986.[9]

The United States was openly opposed to the Soviet Union's participation in the new round of trade talks while the European Communities had publicly taken a somewhat more neutral stance.[10] Even though the rejection of the Soviet application could be explained from a systemic point of view—the Soviet trade regime was incompatible with the GATT[11]—the reasons for this rejection were largely political. As Naray notes, the West did not see at that time that Soviet membership in the GATT would contribute to the liberalization of the Soviet system or provide decisive support to reform-minded forces.[12] As soon as the end of the Cold War was visible, the West's philosophy changed.[13] In December 1989 the United States proposed granting GATT observer status to the Soviet Union. The EU supported this proposal and after the remaining opposition was lifted, the GATT Council approved the Soviet request[14] in May 1990.

The Soviet Union disbanded in December 1991. In June 1993 Russia, as the Soviet Union's successor,[15] filed an application to join the GATT.[16] On July 8, 1993, a GATT Working Party on Russia's Accession ("WP") was established to examine Russia's application.[17] In March 1994 Russia submitted its Memorandum on the Foreign Trade Regime to the GATT contracting parties.[18]

Upon the creation of the WTO in January 1995, the GATT WP was transformed into a WTO WP to consider Russia's WTO accession as a developed country.[19] The WP first considered Russia's Memorandum on the Foreign Trade Regime, and more generally issues related to its trade in goods, economic policies, and the consistency of its foreign trade regime with WTO rules. The negotiations in the 1990s were characterized by their slow speed and lack of substantial progress. In 1998, Russia presented its first tariff proposal and its initial agricultural offer on domestic support. This was followed in 1999 by initial proposals on regional industrial subsidies, services commitments, and a list of exemptions from Most-Favored-Nation ("MFN") treatment. Following the submission of these offers, Russia began a series of bilateral negotiations with members of the Working Party. These discussions showed that opportunities for negotiations on the basis of Russia's initial offers had been exhausted and that new offers had to be made on goods and services. Moreover, Russia had to change its approach on agricultural support.

With the election of Vladimir Putin as Russia's President in 2000, reforms were adopted and WTO Membership began to be viewed as a primary step towards Russia's full integration into the international economy. The government perceived that by remaining outside the WTO the country would lose economic opportunities and not take full advantage of

its ongoing market reforms.[20] Russia's increased participation in the international trade system and an improvement in its ability to attract foreign investment would enhance its economic growth. As part of Russia's new investment policy numerous changes in Russia's legislation and in its regulatory practices needed to be introduced. These important changes were designed to increase the transparency of administrative procedures and to improve the efficiency of Russia's judicial system. Ambitious domestic reforms were launched in many sectors of the economy. Import duties for some 3,500 items were reduced and a new Customs Code was adopted.[21] Russia's WTO accession negotiations thus serve as an external means to advance reform in sectors of Russia's economy that are reluctant to liberalize. Once Russia accedes to the WTO, it will be more difficult to impose radical domestic reforms.

Although Russia's accession negotiations did not advance rapidly in the 1990s, in 2000 it became clear that Russia had overcome its previous sluggishness and had begun to participate in the negotiations with renewed vigor. Russia's approach to the accession negotiations grew increasingly realistic and honest: acknowledgement, rather than denial of problems in the country and discrepancies in its legislation characterized this new attitude.

Intensified negotiations in 2000–2002 led to an assessment by the WP of the results of the bilateral negotiations as well as Russia's effort to bring its legislation into conformity with WTO norms. In January 2002 the WP decided to prepare its report,[22] and on April 24–25, 2002, in the course of the 14th session of the WP, the first chapter-by-chapter reading of the WP's draft Report took place. The Report summarizes the results of the negotiations and lists the commitments Russia must accept upon completion of the negotiations.[23]

II. Current State of Play and Key Issues

A. Current Situation in Negotiations Between Russia and WTO Members

Russia's accession negotiations are being held in four main areas: access to the goods market, agricultural issues, services market access and systemic issues. There are approximately seventy countries that are Members of the Working Party on Russia's accession, of which more than fifty are participating in the negotiations on market access for goods, and more than thirty in the negotiations for market access for services.[24]

Russia seeks to negotiate transition periods before it must apply the full range of negotiated concessions. However, most WTO Members insist that special transition provisions that were valid for original WTO Members not be applied for newly acceding countries.[25]

[24] List of Members that participate in the WP is available in English at http://www.wto.ru/russia.asp?f=wrkgrp&t=11 (visited November 14, 2003) in Russian at http://www.wto.ru/russia.asp?f=wrkgrp&t=11 (visited November 14, 2003).

[25] Transition periods have been often the subject of discussions in accession Working Parties of acceding countries. The transition periods granted to original WTO Members have not been automatically granted to governments acceding under Article XII, regardless of their level of development. A few transition

Countries seeking to accede to the WTO now must use the negotiation period to ensure the consistency of their legislation with the provisions of the WTO Agreements.[26] Moreover, it is expected that newly acceding countries will undertake obligations that go beyond the existing WTO provisions (so-called "WTO plus" requirements).[27] Countries with transitional economies are requested to join plurilateral agreements, such as the Agreement on Government Procurement, as well as to undertake obligations that go beyond WTO norms, e.g., in respect of privatization and state trading.[28]

Russia's position is that the terms and conditions of Russia's accession must be based on standard WTO requirements,[29] i.e., the rules and provisions set forth in the Uruguay Round Agreements.

B. Trade in Goods

1. State of Play in the Negotiations on Industrial Goods

The main subject of discussion in the negotiations on goods between WTO Members and Russia is the maximum level of import tariffs that Russia will have the right to apply after accession (the "bound rate"). The primary stumbling block for Russia is the Members' insistence that one hundred percent of tariffs be bound. Moreover, Russia would have to eliminate and bind at "zero", all charges on imports other than tariffs, domestic taxes, and fees applied for services rendered.

Russia initially proposed tariff bindings close to the applied rate for fifty percent of tariff lines. The gap was larger for such products as textiles. Too large a gap between bound and applied tariff rates opens the door for the government's use of protectionist measures under pressure from domestic industry. Too small a gap may be dangerous since the government is left with little maneuvering room to make tariff adjustments in a period of economic restructuring—the result of this could be irreparable economic damage in crucial sectors.[30] Russia's initial proposal foresaw an average level of bound tariffs of 24 percent after accession, which would subsequently be reduced to eighteen percent after a transition period.[31] Members expressed dissatisfaction with this offer[32] and Russia has since revised it three times. Now the average level of bound tariffs in the Russian offer is eleven percent.[33] Current progress in the negotiations on industrial goods

periods have been granted in limited areas and for short periods of time. In general, Members pointed out that there was no provision for the automatic granting of transition periods to acceding governments. The transition periods contained in the WTO Agreements were accorded to original Members to help them become accustomed to their new obligations. Acceding governments were in a different position, as they had known the requirements of the WTO Agreement since the date of its entry into force. Nevertheless, some Members said that they were not, *a priori*, opposed to transition periods, provided that there was a clear justification for them (*Technical Note on Accession Process*, WT/ACC/7 (March 10, 1999), at 3, 6 and 7).

[33] Personal interview with a WTO negotiator.

has been substantial[34]—Russia has come to an agreement with Members on most of its tariff positions[35]—whereas in the area of agricultural products the situation remains more complex.[36]

While it is difficult to predict Russia's level of bound tariffs after accession, the bound rates of other acceding countries may offer an indication. In agriculture tariff bindings range from 11.7 to 34.9 percent; for non-agricultural products tariff bindings range from 6.7 to 20.1 percent.[37] The tariff commitments undertaken by new members are rather liberal compared to the ones negotiated by members during the Uruguay Round. Consequently this could lead to the increased requirements for candidates applying for WTO accession.[38]

Russian officials underline that the accession negotiations hinge on two points.[39] *First*, in the period immediately following its accession, Russia wants a transition period, and in the initial stage of this transition period it does not want to reduce existing tariffs on any items.[40] When the transition period expires, applied rates would be slightly lower than the existing tariff levels. Lower rates would primarily be applicable to sectors where the reduction of tariffs is immaterial to Russian manufacturers (e.g., certain types of farm products and industrial raw materials, or semi-finished goods that are unavailable or are in short supply in Russia), or where Russia is interested in importing foreign goods (e.g., advanced process equipment, computers and medical research equipment). *Second*, Russia's acceptance of any non-binding sectoral agreements or initiative cannot serve as a precondition to Russia's accession to the WTO.

Russia conducted trade remedies investigations for several products such as poultry, ball bearings and wallpaper. The Russian government decided to maintain its quota for sugar imports for 2004.[41] The tariff rate on imports of more expensive types of furniture was increased to twenty percent in order to protect domestic producers.[42] In 2003 Russia imposed quotas on poultry,[43] and tariff rate quotas on pork,[44] and beef [45] imports.[46] Arguably, these defensive measures, enacted parallel to the accession negotiations, might add to Russia's bargaining power in other areas since it could use the removal of these measures as a trade-off in the forthcoming negotiations. As one would however expect, the

response among Members to these measures was very negative: Members expressed their disappointment indicating that this was a major step backward from trade liberalization.[47]

2. Important Issues in the Industrial Goods Negotiations[48]

In the area of industrial goods, the most problematic issues relate to Russia's tariffs on cars, furniture, textiles, machinery and civil aviation (which falls under a plurilateral agreement). In 1995 Russia "rationalized" tariffs between 5 and 30 percent on most items.[49] This was done through a simultaneous decrease of tariff peaks and an increase in minimum rates, which before this move were sometimes set at zero.[50] Although in 2001 Russia further reduced maximum tariff rates from 30 to 20 percent for most products that historically faced high protection, the tariff for automobiles was not reduced. Initially Russia sought to negotiate a 25 percent tariff for automobiles, however, the government subsequently made the decision to increase the proposed level of tariff protection to 35 percent.[51] One effect of such a high tariff might be to motivate investors to establish automobile production facilities in Russia. Pursuant to Russia's proposal, further tariff on automobiles would follow a "6+1" formula,[52] in which duties are not reduced gradually, i.e., each year, but abruptly, upon expiry of the final year of the seven year transition period.

Apparel and Footwear: The goal of negotiations in apparel and footwear was to maintain the level of existing rates. However, this goal turned out to be problematic for many Members, therefore, Russia will have to increase concessions and reduce the binding level. Certain modifications in the rates of duties on raw materials and semi-finished items for textile articles are extremely likely.[53]

Information Technology ("IT") Products: Russia made an offer to reduce, after accession, tariffs on IT products gradually over three or four years.[54] This appeared to be insufficient as many Members insisted on Russia's acceptance of the Information Technology Agreement ("ITA") and that all tariffs in this sector be bound at zero. While refusing to sign the ITA,[55] Russia is considering whether to accept zero tariffs on some IT products.[56]

Civil Aircraft (Plurilateral Agreement): Another disputed issue is Russia's participation in the plurilateral Agreement on Trade in Civil Aircraft. This Agreement requires the elimination of tariffs and value added taxes ("VAT") on imported aircraft, with the exception of military aircraft, and products used for the manufacture, repair, maintenance,

rebuilding, and modification or conversion of civil aircraft. Article XII of the Agreement Establishing the WTO provides that the procedures for accession to plurilateral agreements are different from accession to the WTO itself.[57] Nevertheless, Russia has experienced significant pressure from the United States[58] and the EU to accept this Agreement.[59] Being a plurilateral agreement, this Agreement was not part of the "single undertaking" of the Uruguay Round and, in line with its strategy of not accepting commitments that go beyond the standard requirements of the single undertaking, Russia refuses to accept it.[60] If Russia joins this Agreement, this would limit Russia's ability to provide government support to its aviation sector.

Russia seeks to maintain a certain level of protection for its aviation industry, a priority sector for development.[61] Russia may eventually agree to lower protection for regional aircraft, aviation industry products not produced in Russia, and/or aviation industry products not used by Russian producers as inputs.[62] If Russian manufacturers can buy imported inputs used in aircraft production at lower prices, particularly when inputs are not produced in Russia, the domestic industry would benefit.[63]

C. Agriculture

1. Level of Domestic Support

The agricultural negotiations are both essential and problematic for Russia. In addition to tariffs, the negotiations include Russia's policy on domestic subsidies, and export subsidies for agriculture products. Russia seeks to develop its agricultural sector to a level that would provide for its food security. Russia is thus trying to negotiate terms of accession that would allow it to provide subsidies and tariff protection comparable to that which the original WTO Members are permitted to provide. However, the agricultural commitments made by countries recently acceding to the WTO reflect the "more stringent ('WTO plus') approach" advocated by the main agricultural exporters.[64]

[57] Article XII states:

> 1. Any State or separate customs territory possessing full autonomy in the conduct of its external commercial relations and of the other matters provided for in this Agreement and the Multilateral Trade Agreements may accede to this Agreement, on terms to be agreed between it and the WTO. Such accession shall apply to this Agreement and the Multilateral Trade Agreements annexed thereto.
>
> . . . .
>
> 2. Accession to a Plurilateral Trade Agreement shall be governed by the provisions of that Agreement.

[64] Naray, supra note 3, at 131.

Russia's agricultural negotiations began in 1998 after Russia made its initial proposal containing commitments on the bound level of domestic support for agricultural production (aggregated measure of support or "AMS"),[65] and export subsidies for agricultural products. Negotiations on the level of amber box subsidies have made little progress. The parties are unable to agree on the level of domestic agricultural support that Russia may maintain after its accession.[66]

The initial binding level is usually calculated based on an annual average value of actual costs over the three latest representative years ("baseline period"). Meaningful calculation of Russia's agricultural support levels is not easy due to the difficulty of choosing representative years. In the three years prior to its application for accession Russia, like many transitional economies, was in the midst of hyperinflation and exchange rate instability.[67] Russia's initial proposals[68] concerning amber box measures and export subsidies were therefore based on pre-crisis figures using a 1989-1991 base period.[69]

The 1998 offer provided an initial AMS level of US$84 billion, and export subsidies of $1.6 billion. Russia twice revised its proposal on domestic support and export subsidies after receiving criticism from many Members, including the United States and the EU.[70] In 2000, Russia proposed two base period options for AMS calculation purposes: (1) 1989–1995, with a $62.4 billion support level, and (2) 1989–1995, minus the minimal and maximal values in the given period (1992 and 1990), equal to $35 billion. On export subsidies Russia proposed a 1988–1995 base period, with a $0.64 billion binding. Russia's March 2001 proposal used the 1991–1993 base period for domestic support and the 1990–1992 base period for export subsidies. With respect to AMS, the March 2001 proposal foresaw a binding of $16.2 billion, which would be phased down to $12.9 billion over six years. In 2001 Russia also proposed $726 million for bound export subsidies, which would be phased down to $464.7 million within six years.[71] Currently the Russian government proposes another reduction in the agricultural support level to $9 billion.[72]

Russia's proposals were opposed by the Cairns group countries, eighteen leading exporters of agricultural products, including Australia, New Zealand and Canada.[73] The Cairns group has proposed that 1997–1999 be used as the representative period. Moreover, the general approach is that newly acceding Members cannot reserve the use of export subsidies for a later date and that new Members should bind these subsidies at zero.[74]

Due to Russia's unfavorable climatic conditions, transport problems, and the high levels of agricultural support applied by the EC, a potentially important agricultural export market, Russia seeks to reserve the right to provide a reasonable level of agricultural support. Although in recent years Russia's agricultural support has been insignificant—approximately US$2–3 billion,[75] because of the high level of EU agricultural support, Russia wants to reserve the possibility to use comparable subsidies if need arises and its economic situation permits.

The tension over the base period and scope of amber box funding continues. While bound levels of domestic agriculture support are higher than actual government spending on the development of the agricultural sector in most WTO countries, WTO Members continue to criticize the inconsistency of Russia's position: Russia has proposed binding at levels far higher than its current level of expenditure.

2. Important Issues in the Agricultural Tariff Negotiations Beef, pork, poultry and sugar:

Russia would like to reserve the option of applying tariff quotas to certain agricultural products such as beef, pork, poultry and sugar.[76] In 2003, Russia introduced tariff rate quotas on imports of beef and pork, as well as a quota on poultry.[77] There is also a tariff rate quota on sugar that was renewed for 2004. The introduction of quotas on agricultural products has further complicated the accession negotiations, as many Members view such measures as a step in the wrong direction.[78] The USTR, Robert Zoelick, said that "failure to remove the quota on poultry and the tariff rate quotas on beef and pork would risk Russia's WTO Membership."[79]

Butter: The government seeks to negotiate a bound tariff for butter that would secure the interests of Russian producers. Russia proposed a bound tariff 1.5 to 2 times higher than the current applied rate.[80]

Wine, spirits, cigars and cigarettes: A trade-off may be achieved with respect to the final bound tariffs on beer, wine, spirits, cigars and cigarettes.[81] However, Russia does not want to reduce the existing level of tariff protection immediately after accession.[82] Members have requested that Russia liberalize its regime for production and importation of alcoholic beverages.[83] Currently, foreign companies do not produce alcoholic drinks in

Russia apart from beer.[84] Spirit production is a state monopoly and it is almost impossible to obtain a license. Russia's alcohol industry is powerful and it will not relinquish its position easily.[85]

D. Trade in Services

In order to accede to the WTO, Russia must undertake obligations to liberalize its services sector pursuant to the terms of the General Agreement on Trade in Services ("GATS"). Russia must also make commitments in accordance with the List of Specific Commitments in Services, in order to assure a certain level of market access for WTO Members.

Russia submitted its original services proposal in October 1999, but the negotiations made little progress due to a sharp divergence between Russia and the Members on the degree of liberalization that Russia should undertake when it accedes to the WTO. A second proposal was presented to the Members in February 2001 and the third proposal in April 2002.

Bilateral talks were held on trade in services throughout 2002 and 2003. The negotiations identified sectors that require additional effort to determine mutually acceptable conditions for access by foreign service providers to the Russian market. The most problematic areas are financial services (insurance, banking and securities), telecommunications and transport services (especially marine and air transport).[86]

Apart from different opinions as to the level of Russian commitments in the services sector, it is important to the Members that Russia guarantee that its concessions will be implemented. Another problem in the services area is related to the economic cooperation agreements that Russia has concluded with other CIS countries, as these agreements must be brought into conformity with Article V of GATS. Furthermore, it is important that Russia provides transparency of its laws and regulations in the services area, such as those related to qualification and licensing requirements, as well as other authorization procedures. Finally it is indispensable that regulating authorities in the services sector be independent from the service suppliers they regulate.

The basis of Russia's protectionist position is a desire to secure the benefits from liberalization on the domestic market and to avoid foreign companies' gathering the "cream" from wealthy Moscow consumers without investing in the provision of services, particularly telecommunications and banking services, in regions that need such investment.[87] Strong domestic pressure from domestic service providers has helped shape this position.

WTO Members currently request from acceding countries more specific commitments on market access than during the Uruguay Round. For instance, WTO Members expect that new Members will undertake broader obligations in telecommunications and financial services.[88] Although countries that recently acceded to the WTO stipulated the same horizontal limitations as original WTO Members (such as restrictions on the acquisition and ownership of real estate, subsidies and limitations on the presence of natural persons), unlike some original Members, the new Members have undertaken specific

commitments in a larger number of sectors.[89] These sectors include professional services (primarily accounting, law, architecture and engineering), business services, communication services, financial services, construction services and distribution services.[90] Some Members have undertaken commitments in environmental, health and social, tourism and transport services.[91] Few Members have undertaken commitments in audiovisual services.[92]

1. Banking

There are numerous regulations governing the establishment of Russian banks and the conduct of banking operations. These regulations became the focus of discussion in the accession negotiations. Stringent currency regulations have also been scrutinized.[93] Russia's position in the beginning was strongly protectionist. Later, the Central Bank and the Ministry of Finance took a more pragmatic approach towards liberalization.[94] In part this is because the banking sector is saturated and foreign banks have already become niche players.

Important questions have arisen in the course of accession concerning the simplification of regulations in the financial sector, including currency restrictions. The ownership by the Central Bank of Russia ("CBR") of two major Russian banks, Sberbank and Vneshtorgbank, poses another contentious issue since the CBR carries out prudential regulation of the banking sector. Moreover, there is concern among Members about state guarantees of household deposits held by Sberbank when deposits held by other banks do not receive the same guarantees.[95] The government is currently devising a new guarantee system that would end Sberbank's monopoly, and which would give other banks much-needed long-term funds for lending.[96] The new law on the CBR provides for CBR's sale of Vneshtorgbank, thereby addressing the potential conflict of interest between CBR's ownership of commercial banks and its prudential function.[97] However, the new law does not require the CBR to sell Sberbank.

2. Insurance

Barriers existing in the Russian insurance sector do not permit foreign insurers to carry out business effectively in Russia since many types of insurance can only be provided by Russian companies. Russia seeks a high level of protection for its insurance sector.[98] It wants to bar foreign insurance companies from operating in Russia through branch offices

and from providing the main types of compulsory insurance.[99] The insurance industry is politically powerful and as a result negotiations in this sector have not advanced quickly.

The EU is strongly opposing Russia's proposed limitations in the ongoing accession negotiations. Russia breached an agreement with the EU whereby in 1999 Russia was to open its insurance market to foreign owned insurers (more than 49 percent foreign owned).[100] The agreement provided that additional limitations would not nullify the removal of the 49 percent ownership limitation.[101] Although Russia did remove the 49 percent ownership cap, it imposed new limitations on the main types of services, including restrictions on the sale of life insurance and compulsory insurance.[102]

The Russian government is now devising a law that would bring the treatment of European insurance companies into conformity with its bilateral agreement.[103] If, however, Russia creates a preferential regime for EU insurance companies, upon accession to the WTO it will be obliged to grant equal treatment on an MFN basis to other foreign insurance companies.

Discussions are also ongoing on whether to allow foreign companies to sell certain insurance products that can now only be sold by Russian companies. Russia does not want to increase the quota for foreign capital on the insurance market. Currently foreign insurance companies represent only seven percent of the capital in the market, i.e., well below the permitted level of fifteen percent.

3. Telecommunications

The main disagreement in the telecommunications sector concerns Russia's plans to introduce a 49 percent cap on foreign ownership of telecommunications companies. This restriction presently does not exist.[104] Russia is also defending the position of Rostelecom, the government controlled telecommunications monopoly in the accession negotiations.[105] Russia seeks to perpetuate Rostelecom's long distance monopoly for at least five years after accession.[106] Recently Members expressed "dismay with a new law which they fear could significantly dampen market access opportunities for their telecommunications firms in Russia."[107] One major concern relates to a significant increase in the interconnection rate paid by foreign telecoms firms to Rostelecom. The law also foresees the establishment of a fund for the support of universal service provision in rural areas. All service providers would be required to contribute. Many Members,

[107] Pruzin, *supra* note 95.

including the EU, are insisting on increased liberalization in this important sector and an elimination of Rostelecom's monopoly.

4. Transport

One of the most controversial accession issues is the over-flight fees that foreign airlines must pay Aeroflot when crossing Russian airspace. Since the 1970s, Aeroflot, which is 51 percent state-owned, has been receiving "overflight fees" from all foreign airlines that cross Russian airspace. Russia's trade partners, such as the EU, are requesting the elimination of these charges which they view as an anti-competitive practice.[108]

EU officials, who say the fees violate basic principles of the WTO, are reportedly willing to compromise.[109] They suggest continuing the system for a few more years and using the funds to modernize Russia's antiquated air traffic control system, rather than using the money to subsidize Aeroflot. According to an EU representative in Moscow, Russia refused to discuss modifying the fee system during negotiations in 2002.[110] The Russian transport ministry has however indicated that there could be some changes in the over-flight fee system, and that Russian officials have not told the EU that they are "completely against" the fund to modernize its air traffic control system.[111] Discussions on this topic are continuing.[112]

E. Domestic Price Control Over Energy and Gas

WTO Members have expressed strong concerns about the trade distortions caused by state control over the pricing of energy for domestic consumption (e.g., gas, oil and electricity). The state pricing policy is applied to assure low domestic prices. Its application results in a sizeable price differential between what companies based in Russia pay and the price paid by purchasers abroad.

The main industrial powers are conditioning Russia's WTO accession on its liberalization of energy prices. Russia faces serious demands from the EU[113] and the United States to eliminate state control over prices for energy consumed by domestic industrial users. These demands apply primarily to gas prices, which are imposed by the government, one of the major shareholders in Gazprom, the monopoly dominating the gas market. Foreign purchasers abroad pay up to six times[114] more than what domestic purchasers pay for *natural gas*.[115] Gazprom openly states that it supplies gas to the internal market[116] at a

[108] *See* Daniel Michaels, Guy Chazan and Zach Coleman, *Moscow Pockets Millions In Fees to Fly Over Siberia*, Wall Street Journal (July 1, 2002).

[109] *Id.*

[110] *Id.*

[111] *Id.*

[112] In 1997, the only year the Association of European Airlines calculated what its Members paid Aeroflot, the total was US $225 million, according to the organizations' annual report. Association officials say the figure was much higher in 2001. The airlines agreed to pay the fees since flying over Siberia produced huge savings compared to flights over the North Pole. *See* Michaels et al. *supra* note 108.

[113] *See* Эл Брич, Маттиас Вестман, *Россия и ВТО: Напрасный страх Европы,* Ведомости (28 апреля, 2003).

[114] Rafael Behr, Andrew Jack, *Russian Talks on WTO Entry Stall Over Energy*, Financial Times (February 18, 2003).

[115] The data from the OECD report show that in 2000 the difference between the average industrial prices for gas in Russia and OECD countries was about eleven times. *See* OECD Economic Surveys, Russian Federation, Volume 2002/5-February, at 118.

[116] According to the OECD report (*supra* note 115, at 105) "almost 40 percent of natural gas supplied domestically goes toward the generation of electricity."

loss, which it compensates through high export prices.[117] Gazprom seeks therefore to increase the prices for gas.[118] The regulation of *electricity* rates has been criticized as allowing domestic companies to receive energy at prices four to five times below the average industrial prices for electricity in the OECD countries.[119] While the oil market is more deregulated, the domestic prices for crude *oil* are four times lower than the world market price.[120] This dual pricing system is viewed by the United States and the EC as a subsidy to Russian industrial producers, as they do not have to pay the full market price for their energy inputs.[121] This situation adversely affects the ability of imported goods to compete on the Russian market. Russian products have also an advantage competing with other countries' products in third-country markets.[122] Therefore, the demands to eliminate its pricing system result primarily from the interests of foreign industries that have energy-intensive production.

Another possible reason for these demands is relatively high price of energy products on the world market. The main Members demanding unification of oil and gas prices in Russia are dependant on oil and gas imports and are primarily interested in a decrease in world prices for gas and oil. If the internal price for Russian oil and gas rose, the demand for these resources would fall within Russia. As a result Russia would export more gas and oil and international prices would fall.[123]

Russia does not accept that Gazprom's practice, imposed by the Russian government, is inconsistent with WTO rules on subsidies.[124] Russia's argument is that WTO rules only cover subsidies specific to a particular enterprise, industry or region.[125] It argues that in this case, the subsidies benefit Russia's entire economy and not specific industries.[126] The availability of gas at lower prices to domestic companies is not contingent on export performance and is in accordance with the non-discrimination principle.[127] Moreover, transportation costs amount to eighty percent of gas prices.[128]

Russia also argues that if its energy prices are to be increased to international market rates, a transition period would be necessary. Domestic prices would have to be increased by five to seven times. Such an increase could lead to widespread economic collapse given that many industrial sectors would be seriously affected.[129]

[125] *See* Article 1.2 of the SCM Agreement.
[126] The fertilizer industry enjoyed some benefits in this respect in the past, however the Order of the Federal Energy Commission No. 12/1 of March 24, 1999, which granted a fifty percent reduction in gas prices to producers of chemical fertilizers, was repealed.
[127] The draft law "On State Aid" prohibits state support based on export performance or import substitution.
[128] *See* the interview with the Minister of Economic Development and Trade of Russia, German Gref, Коммерсант (October 28, 2002).
[129] Константин Смирнов, *supra* note 83.

Moreover, Russian officials also state that Russia's abundance of raw materials and energy is a "natural comparative advantage" which results in low prices.[130] However, according to some analysts, the prices for energy are lowered artificially and do not result from a comparative advantage.[131] Most likely, according to Ilia Marshak, a Moscow-based analyst, the government believes that the process of price unification is complicated and it does not want to undertake any additional international obligations in that respect.[132]

Russian negotiators openly state that they consider demands related to equalizing energy prices a test of the strength of their position.[133] Energy pricing will be one of the most important issues in the course of the forthcoming negotiations.[134] Mr. Medvedkov, the Russian chief negotiator, argued that Russia will be fighting for its position regarding energy pricing until the end: "The country that has resources decides on its own at which price and to whom to sell them".[135]

Despite the evident domestic political importance of this issue,[136] it is in Russia's interest to reform its energy sector and ultimately unify its internal and export prices for energy. First, Russia's low domestic energy prices foster the inefficient consumption of energy resources by Russian industry,[137] and give little incentive for Russian industry to adopt energy efficient technology. Second, elimination of the dual pricing system would mean that the Russian energy industry would be able to profit from trade on the internal market.

The Russian government realizes that reform of the energy sector is crucial for its development.[138] Although it has so far refused to accept any binding WTO obligations, the government does have plans for increasing domestic gas and energy prices. It intends to do so gradually and seeks to avoid the imposition of external requirements or a timetable. A plan for the reform of Gazprom was presented in December 2002. Gazprom officials stated that the concept of energy sector development foresees the unification of gas prices on the internal and external market by 2020, taking into account transport costs.[139] The authors of the reform of another firm, RAO UES of Russia,[140] did not propose increasing internal prices all at once either; indeed, such a process would take several years.[141]

[136] Elimination of the dual price system would have adverse economic effects for industries operating in Russia and might undermine both political and social stability.

[137] Смирнов, Корнышева, *supra* note 117.

[138] The OECD report states in this respect: "The Russian government has come to recognize the existence of serious problems in the gas and electrical power sectors of the economy, and the unsustainability of current trends. Subsidization through cheap energy has encouraged inefficient and wasteful energy consumption. Both the gas and electricity sectors are in need of large fixed investment to continue or expand their current operation, while the burden of administering and financing implicit subsidies has seriously complicated the efforts to accumulate internal or external capital for this purpose." *See* OECD, *supra* note 115, at 106.

[139] *See* Екатерина Кравченко, *Миллер победил Грефа,* Финансовые Известия (25 июня 2003).

[140] Russian Joint Stock Company United Energy System of Russia.

[141] Смирнов, *supra* note 83. *See also* Press Release of the Russian Ministry on the Economic Development

In conclusion, Russia's present strategy is to refuse to make binding commitments on energy pricing, arguing that its current pricing practices are consistent with WTO rules. At the same time, the government is devising plans for restructuring its energy sector,[142] including the elimination of state price controls on the domestic market.[143] However, Russian officials stress that this reform will be gradual and not subject to any binding WTO commitments.

F. Other Important Issues and Legislative Developments

1. Work on Bringing Russia's Laws into Conformity with WTO Rules

In accordance with the conditions of Article XVI of the Agreement Establishing the World Trade Organization, "each WTO Member shall ensure the conformity of its laws, regulations and administrative procedures with its obligations". Members are insisting that Russia bring its law, regulations and measures into conformity with WTO rules and consider the completion of this process a prerequisite for accession. Typically, acceding countries are "requested to meet all commitments upon entry" without transition periods and "regardless of whether institutional weaknesses make it difficult for them to fulfill such commitments."[144]

Although much of the required legislative reform serves Russia's long-term economic interests, the requirements to undertake immediate commitments in customs valuation, trade-related intellectual property rights, technical regulations, standards and phytosanitary norms pose problems because Russia lacks the institutional base to implement these commitments.[145] This insufficiency explains some of the delays in the accession process, as numerous laws must be adopted and state agencies created or restructured.[146]

The Russian government has made legislative reform a priority and has launched an ambitious plan to achieve the reform prior to the WTO accession.[147] Among the new laws that have been adopted, or are in an advanced stage of development, are the new Customs Code; the Law on Licensing Fees and the Right of Production and Trade in Ethyl Spirits, Alcohol, and Spirit-Containing Products; the Law on Safeguards, Antidumping and Countervailing Measures; the Law on Licensing of Export and Import of Goods in the Russian Federation; the Law on Currency Regulation and Currency Control; the Law on Government Support; Chapter 27 of the Tax Code of the Russian Federation (regulating customs duties and fees); the Law on State Regulation of Foreign Trade Activity; and the

[144] Michalopoulos, *supra* note 67, at 31.

[145] *Id.*

[146] Institutional changes are not limited to the adoption of the new laws. For transitional economies they often involve the establishment of new administrative capacities and substantial changes in technologies and new investment. *See* Zdenek Drabek, Marc Bacchetta, *Effects of WTO Accession on Policy-Making in Sovereign States: Preliminary Lessons From the Recent Experience of Transition Countries*, WTO Staff Working Paper DERD-2002-02 (April 2002), at 24.

Law on the Basis of Technical Regulation in the Russian Federation. The government aims at completing the process of bringing national legislation into conformity with WTO rules in 2003.[148]

2. Other Important Issues in Russia's Accession Negotiations

In the course of accession negotiations Members expressed concerns about Russian customs practices, in particular of customs valuation procedures and rules of origin. Russia must also revise its legislation and practices in the areas of standardization, certification, sanitary and phytosanitary measures, currency control, and the protection of intellectual property rights. Russia will need to give special attention to its implementation of laws, as there is a large gap between law and actual implementation practice. Implementation is complicated by the size of the country and its sophisticated federal system.[149] Specific issues are examined in more detail below.

(a) Customs. Foreign companies have often complained not only about high Russian tariffs on some products, but also the lack of transparency of its tariff regime, arbitrary valuation methods, the arbitrary grant of duty exemptions, and frequently changing and complex customs practices.[150] Some Members have also complained that regulations imposed by Russia on imports of wine, petroleum products, tobacco and chicken constitute a disguised restriction on trade, as do the limited number of authorized check-points to inspect these goods, and the location of these check-points far from the most convenient points of entry.[151]

Russian customs procedures have been inefficient, complicated and often discriminatory. Implementation of these procedures is at the discretion of often corrupt customs officials. Russia's WTO accession is contingent upon reform of its customs system. Reform is under way and a new Customs Code has been adopted.[152] Most provisions of the new Customs Code[153] are directly applicable, meaning they do not require further procedural acts of the Federal Customs Committee. This should limit the issuance of controversial instructions and the exercise of discretion by customs authorities.

(b) Quotas and Restrictive Licensing. WTO Members have asked the acceding countries to accept, from the date of accession, a commitment to eliminate and not introduce, reintroduce or apply quantitative restrictions or other non-tariff measures such as licensing, quotas, bans, permits, prior authorization requirements, licensing requirements and other restrictions having equivalent effects which cannot be justified under the WTO Agreements.[154] Members are concerned about certain Russian quantitative restrictions and non-tariff measures:

[148] Work remains to be concluded on the WTO-consistency of the normative acts of the ministries, regional legislation, and Russia's bilateral and multilateral agreements.

[149] NARAY, *supra* note 3, at 100.

[150] *Id.* at 104.

[151] Personal interview with a WTO negotiator.

[152] Таможенный кодекс Российской Федерации от 28 мая 2003 г. N 61-ФЗ (Customs Code of the Russian Federation No. 61-FZ (May 28, 2003)).

[153] The Customs Code will enter into effect January 1, 2004.

[154] NARAY, *supra* note 3, at 108. The laws and regulations governing the establishment of foreign companies in Russian territory, including the issuance of activity licenses, should not restrict imports in violation of the prohibition of quantitative restrictions under Article XI of GATT. Such regulations must not discriminate against imported goods in violation of Article III of GATT. Finally, the charges and registration fees that companies have to pay should be limited to the cost of services rendered.

- Russia's current system of licensing for the sale of alcoholic beverages discriminates against foreign companies. For example, import licenses are issued only to companies that hold an "activity license".[155] Furthermore, quantitative restrictions exist—the annual volume of imported alcoholic products (except for wines, cognac and beer) cannot exceed ten percent of alcoholic beverages sold in Russia.
- Licensing requirements are applied to the processing, transportation, storage and sale of oil and gas.
- Due to health concerns, licensing requirements exist for the production of pharmaceuticals and medicines.[156] Companies engaged in pharmaceuticals trade need a special license for import of pharmaceuticals.[157] Foreign firms can only obtain such a license after the establishment of a representation office on Russian territory.[158] Some Members demand that Russia commit to the automatic grant of import licenses on pharmaceutical products. Foreign companies complain that the licensing requirements for pharmaceutical products are extremely burdensome,[159] in part because pharmaceutical products must be re-registered once every five years,[160] and such registration can take more than one year.[161]
- Quotas exist for the export of platinum, non-ferrous metals containing precious metals, and uncut natural diamonds. Export licenses are required for the export of these items.

(c) Technical Barriers to Trade ("TBT") and Sanitary and Phytosanitary Measures ("SPS"). Foreign companies doing business in Russia have often criticized Russia's burdensome certification, standards and labeling procedures as being obstacles to trade.[162] Members are concerned that TBT requirements will be applied to nullify Russia's tariff concessions. In particular, this concern is related to labeling (most importantly, the labeling of spirits). One important TBT concern is that regulations are devised and applied in a way that makes it more difficult for foreign companies to comply with them than for their Russian competitors. Russia's technical regulations are extremely broad and complicated and lack systematization and transparency. Currently the Russian government is carrying out an extensive reform of its technical regulations. The government launched a special "Program of Measures to Ensure Compliance with the Requirements of the WTO

[155] An "activity license" means a license that permits an entity or person to carry out a particular type of activity, e.g., insurance, construction, banking, trade in certain products, etc.

Agreement on TBT and the WTO Agreement on SPS". A new law "On Fundamentals of the Technical Regulation, Standardization and Confirmation of Conformity", which aims at establishing a WTO-compliant framework, was recently adopted. Russian authorities must now review related legislation for conformity with the law and the TBT and SPS Agreements.

Members are demanding that Russia harmonize its technical, sanitary and phytosanitary standards on the basis of international standards, guidelines and recommendations as mentioned in Article 3 of the SPS Agreement. SPS rules must be based on scientific risk assessments when more stringent than international standards.[163] SPS measures must not discriminate in favor of domestic production where identical or similar conditions prevail.[164] In addition, some Members have requested that Russia recognize certificates issued by the competent authorities of WTO Members.[165] Harmonization of Russian standards with European standards is of considerable interest to Russian exporters.[166]

(d) Protection of Intellectual Property Rights. Upon accession to the WTO, Russia must fully apply the provisions of the TRIPS Agreement. Russia has been a Member of the World Intellectual Property Organization since 1970 and is a signatory to the major intellectual property conventions incorporated into the TRIPS Agreement, including portions of the Paris, Berne and Rome Conventions.[167] Russian legislation is generally consistent with the provisions of the 1989 Treaty on Intellectual Property in Respect of Integrated Circuits.[168] In the area of intellectual property rights, problems are not so much associated with the lack of enacting legislation, but rather with Russia's failure to enforce its intellectual property laws. A report by the International Intellectual Property Alliance ("IIPA") pointed out that overall copyright industry losses exceed $1 billion per year.[169] Very high estimated piracy levels in all copyright sectors accompany massive losses: Piracy in Russia accounts for 66 percent of music sales, 80 percent of film sales, 87 percent of business software and 90 percent of entertainment software.[170] The counterfeiting of trademarks is also a large problem. The IIPA insists on more efficient criminal enforcement of IPRs.[171] Such enforcement should also be in the interest of Russia—the report points out that "high piracy levels are costing the Russian economy millions of dollars in lost jobs and lost taxes".[172] For example, "the motion picture industry estimates lost tax revenues on DVDs and videos in Russia was $131 million in 2002."[173]

G. Government Involvement in Trade[174]

The history of the GATT/WTO system demonstrates that "economies comprised of privately owned units are far more likely to provide an environment conducive to the full implementation of WTO rules than economies dominated by state-owned enterprises".[175] Issues related to ownership of economic interests, the degree of privatization in the economy, privileges granted to private enterprises involved in import and export activities and the degree of governmental involvement in trade matters have frequently been raised by WTO Members during accession negotiations. Government involvement in the activity of enterprises that dominate key sectors, such as energy and mineral resources, is a tradition in Russia.[176]

While the WTO Agreements do not require "that a Member must have fundamentally a market economy, such a requirement is being imposed *de facto* by existing Members as part of the leverage they have in the accession process."[177] Although the United States and the EC granted Russia market economy status in 2002, issues relating to the treatment of Russia as a market economy remain open.[178]

Furthermore, Article XVII of the GATT requires Members to ensure that state trading enterprises ("STEs") act in a manner consistent with the nondiscrimination principle. Typically, the protocols of accession of economies in transition contain obligations to apply regulations governing the activities of state-owned enterprises, and require that such enterprises act in full conformity with the provisions of the WTO Agreements.[179]

During accession negotiations, Russia changed the list of enterprises subject to notification as STEs several times. This is understandable as the definition of STEs contained in Article XVII and the Understanding on the Interpretation of Article XVII ("Understanding") is not clear. The main criteria for identifying STEs, set forth in Article XVII and the Understanding, is the granting of special or exclusive rights or privileges to an enterprise.

Gazprom's "exclusive privileges" include the control of the transportation network. Gazprom is obliged to grant access to the transportation network to other companies that trade in gas.[180] These currently amount to 10–12 percent of the total gas sales in Russia.[181] The monopoly of Gazprom's affiliate, Gazexport, over gas exports to Europe and non-CIS countries, raises another issue. As gas prices paid by domestic consumers

[174] On the role of the state in the transitional economies *see* Sam Laird, *Transitional Economies, Business and the WTO*, 22(1) WORLD COMPETITION 171–187 (1999).

[175] Naray, *supra* note 3, at 98.

[176] In the early 1990s exports of energy and raw materials were restrained, first through quotas and licenses and, subsequently, by export taxes. A system of centralized exports was operated through foreign trade organizations. The process of nominating special exporters and granting licenses to export within a quota set by the government lacked transparency. However, export quotas and special exporter lists were abolished in 1995. A system of centralized subsidized imports, aimed at solving Russia's food deficit, was also put in place. Such centralized imports accounted for forty percent of total imports in 1992. They were abolished in 1995. *See* Vladimir Drebentsov and Constantine Michalopoulos, *State Trading in Russia*, in STATE TRADING IN THE TWENTY-FIRST CENTURY 303 (Thomas Cottier and Petros C. Mavroidis eds., 1998); *see also* WTO, Accession of the Russian Federation, *Introductory Note to Questions and Replies to the Memorandum on the Foreign Trade Régime*, WT/ACC/RUS/2/Add.2 (June 2, 1995).

[177] Michalopoulos, *supra* note 67, at 28.

[178] *See infra* Part II(H).

[179] NARAY, *supra* note 3, at 125.

[180] There is clearly a competition issue considering that independent companies have to rely on Gazprom, their competitor, for their transportation needs.

[181] Известия, *Александр Рязанов: Реформу газовой отрасли можно начать в этом году* (9 июня 2003).

do not allow Gazprom to profit domestically, some Members question whether Russia's gas pricing policy is consistent with the requirements of Article XVII, which states that policies of STEs be based on commercial considerations.

Four other enterprises indicated by Russia as STEs are RJSC UES (electricity); JSC Rosugol (coal, dissolved in November 1997); JSC ALROSA (raw natural diamonds); and Almazyuvelir (also raw natural diamonds). RJSC UES possesses special or exclusive rights as it owns most power generating facilities in Russia and the entire power grid. Rosugol's special privilege was the distribution of government subsidies for coal mining and it played an important role in determining the rates for the transportation of coal.[182] However, in 1997, Rosugol was dissolved and its administrative functions transferred to the Ministry of Fuel and Energy.[183] Alrosa used to control the export of raw diamonds. Presidential Decree No. 1373, dated November 30, 2002, abolished the exclusive rights of Alrosa.

Responding to the questions posed by Members, Russian officials informed delegations that there are no STEs in the agricultural sector and that the government has no intention of introducing state trading for agricultural products.[184]

There are misconceptions as to the volume of state trading in Russia. The government has reduced the degree of direct state involvement in trade significantly and more rapidly than could be expected for a country with a state monopoly on trade just a decade ago. In 2001, enterprises with 50 percent or more state ownership accounted for only 13.4 percent of the total production of goods and services and 13.2 percent of total agricultural production.[185] As a result of the transition process, trade in Russia is carried out almost exclusively by private enterprises and the participation of the Russian government in the ownership of enterprises continues to diminish.

H. Recognition of Russia as a Market Economy

Although Russia's main trading partners, the United States[186] and the EU,[187] formally declared in 2002 that they would grant, with some reservations, market economy status to Russia, many countries that represent a substantial export interest to Russian producers have not yet done so. Moreover, although the United States and the EU officially recognized Russia's market economy status, some unresolved issues relating to the treatment of Russian products in anti-dumping and countervailing duty investigations remain.

Russia's recognition as a market economy[188] by its trading partners is of major importance to the Russian government and Russian producers. Recognition as a market economy means that Russian companies and Russian products are treated differently in the course of trade remedies investigations. Members consider that there may be problems of

[184] WTO, *Accession of the Russia Federation—Additional Questions and Replies*, WT/ACC/RUS/4 (November 1, 1995).

[185] *Annual Report On Development of State Sectors of Economy in the Russian Federation in 2001*, Goskomstat.

[186] U.S. Department of Commerce, Press Release (June 6, 2002).

[187] Интерфакс, *Евросоюз окончательно признал Россию страной с рыночной экономикой* (10 ноября 2002).

[188] A term, which, for instance, has been defined in Section 771 (18)(A) of the U.S. Tariff Act 1930, as a foreign country that "does not operate on market principles of cost or pricing structures, so that sales of merchandise in such country do not reflect the fair value of the merchandise".

price comparability when using the domestic prices of non-market economies' ("NME") to establish a dumping margin. Therefore, the methodology applied to determine the normal value for non-market economies in anti-dumping investigations is not the usual methodology prescribed in Article 2 of the Anti-dumping Agreement. In the case of products originating from non-market economies, many investigating authorities, in order to establish the normal value for these products, use either the price of a like product in a surrogate market economy country or a constructed value methodology based on the factors of production of the non-market economy producer and prices for these inputs from a representative market economy. These alternative methodologies easily lend themselves to abuse and manipulation making it easier to find dumping and calculate inflated dumping margins. Obtaining market economy status for Russia would mean that the domestic prices and costs of Russian producers would be used in calculating the dumping margin rather than surrogate country data.

The recognition of a country as a market economy does not follow *de facto* automatically upon accession to the WTO. The only WTO provision pertaining to non-market economies is found in an interpretative note to GATT Article VI. This provision allows for the use of an alternative non-specified methodology for determining the normal value in investigations of products from a country with a complete, or substantially complete, monopoly of its trade and where all domestic prices are fixed by the state.[189] The language of the Agreement implies that normal value determinations with respect to countries whose economic systems no longer respond to the criteria set forth in the interpretative note must be addressed through the regular provisions of the Anti-dumping Agreement, unless otherwise provided for in the specific country's protocol of accession to the WTO.[190] Nowadays it is very difficult to give an example of a country that meets the conditions set out in Ad Article VI. In any case, the situation in Russia does not correspond to this definition.[191]

Given the ambiguity and inadequacy of the rules on the issue of non-market economies in the WTO, some Members have tried to supplement these rules in their own legislation and regulations. This has resulted in diverse domestic legislative and administrative practices that have generated controversy and frustration on the part of some Russian industries. The practice of some Members has moved towards granting *ad hoc* market-economy status to certain industries in non-market economy countries which can prove that they operate under market conditions. This is done on a case-by-case basis: the investigating authority examines whether the characteristics of a market economy prevail in an importing country in relation to a specific industry. These rules have mostly been applied to those non-market economy countries that are not WTO Members or to WTO-Member countries that have recognized in their Protocol of Accession that issues of price comparability for the determination of dumping margins still exist.[192]

[189] GATT Ad Article VI:2 states:

> It is recognized that, in the case of imports from a country which has a complete or substantially complete monopoly of its trade and where all domestic prices are fixed by the State, special difficulties may exist in determining price comparability for the purposes of paragraph 1, and in such cases importing contracting parties may find it necessary to take into account the possibility that a strict comparison with domestic prices in such a country may not always be appropriate.

[190] *See* Alexander Polouektov, *Non-Market Economy Issues in the WTO Anti-dumping Law and Accession Negotiations. Revival of a Two-tier Membership?* 37(1) JOURNAL OF WORLD TRADE 1 (2002).

[191] On government involvement in trade *see* Part II(G) *supra*.

[192] *See Protocol on the Accession of the People's Republic of China*, WT/MIN(01)/3.

With respect to the reservations that both the United States and the EU made when granting market economy status to Russia, it appears that both Members could apply the same approach—using surrogate country data when establishing the normal value, even after recognizing Russia as a market economy. Indeed, the decision of the U.S. Department of Commerce to grant market economy status to Russia reserves the possibility of not taking into account the costs of production inside Russia.[193] In the case of the EC, the new regulation also provides for the possibility of using cost data from "representative markets", if some conditions regarding the accounting of the investigated company are not met.[194] The non-conformity of Russian accounting standards *vis-à-vis* international standards is one of the reasons cited by investigating authorities in a number of countries for using surrogate country data while conducting investigations on Russian products.[195] In addition, Russian steel and other metallurgical producers fear that the low domestic price for energy inputs might also lead to the non-recognition of costs of Russian companies and the use of prices of a third country representative market. The energy issue was reportedly one of the sticking points in the investigation on market economy status for Russia carried out by the United States Department of Commerce.[196]

Although Russia's government and industries are keen to obtain recognition as a market economy, there is a drawback associated with this new status. The drawback is related to the application of CVD measures to Russian products. When the United States granted market economy status to Russia, Russian exporters became subject to CVD investigations, a possibility that did not exist before.[197]

If the United States were to decide to conduct CVD investigations against Russian companies before Russia accedes to the WTO, Russian companies could lose export

[193] The Decision Memorandum of the Department of Commerce states:

> The Department will examine prices and costs within Russia, utilizing them for the determination of normal value when appropriate or disregarding them when they are not. In this regard, the Department retains its authority to disregard particular prices or costs when the prices are not in the ordinary course of trade, the costs are not in accordance with generally accepted accounting principles, the costs do not reasonably reflect the costs associated with the production and sale of merchandise, or in other situations provided for in the Act or the Department's regulations.

[194] Council Regulation (EC) No. 1972/2002 dated November 5, 2002 amending Regulation (EC) No. 384/96 on the protection against dumped imports from countries not Members of the European Communities states in this respect:

> It is considered appropriate to give some guidance as to what has to be done if, pursuant to Article 2(5) of Regulation (EC) No 384/96, the records do not reasonably reflect the costs associated with the production and sale of the product under consideration, in particular in situations where because of a particular market situation sales of the like product do not permit a proper comparison. In such circumstances, the relevant data should be obtained from sources which are unaffected by such distortions. Such sources can be the costs of other producers or exporters in the same country or, where such information is not available or cannot be used, any other reasonable basis, including information from other representative markets.

[195] *See* the text of the U.S. Decision Memorandum regarding the grant of market economy status to Russia, *supra* note 93.

[196] Moscow Times, *U.S. Grants Russia Market Economy Status* (June 7, 2002).

[197] CVD investigations are directed against subsidized imports. A countervailing duty is imposed to offset a subsidy that harms a domestic industry. When an economy is a non-market economy, the national laws of WTO Members generally consider that there are no valid in-country benchmarks for measuring whether a particular government action created a countervailable subsidy, i.e., there are no market prices that can serve as benchmarks for calculations of the amount of the subsidy. Therefore, when Russia was considered a non-market economy, Russian exporters were not subject to CVD investigations in the United States.

markets much more easily than if anti-dumping measures were applied. This is because, pursuant to U.S. law, in a CVD investigation the investigating authority is not obliged to make a determination that the domestic industry has been injured as a result of the subsidized imports if the investigation involves a non-WTO Member.[198] These injury and causal link determinations are required under the WTO SCM Agreement whenever a Member imposes countervailing measures.

The existing difference in external and domestic prices for energy and other inputs provided by Russia's state-owned enterprises makes CVD investigations particularly problematic.[199] This price differential is perceived by many WTO Members as constituting a subsidy favoring the production of energy-intensive products, such as metals. Although only "specific" subsidies fall under WTO rules, e.g., subsidies paid to a specific industry or company, Russia cannot use arguments related to specificity (or lack thereof) to protect itself from CVD measures until it becomes a WTO Member. When a CVD investigation is conducted and a particular subsidy is found to be specific, the investigating authority may use international prices to establish a benchmark for calculating the amount of the subsidy. This would result in a high countervailing duty rate for a Russian exporter, since energy prices in the international market are several times higher than those on the domestic Russian market. For Russian exporters it is thus important not to be subject to CVD investigations until Russia becomes a WTO Member.

The above considerations regarding the use of trade remedies against Russian exports underline why WTO accession is of critical importance to Russian exporters. The government of Russia and Russian industries want an express recognition of market economy status from WTO Members, and the WTO accession negotiations provide an opportunity to negotiate this recognition. This recognition is not just of practical importance to Russia but would also have moral value, constituting international acknowledgment of the difficult and extensive economic reform process that Russia has undertaken since the collapse of the Soviet Union. Nevertheless, it remains to be seen whether WTO Members would accept such a solution to the legal uncertainty created by the *status quo*,[200] as a formal recognition of Russia's market economy status in its Protocol of Accession may face strong domestic opposition within some Members.

It could be argued that the *status quo* favors Russia as it would be difficult for a Member to prove that the conditions in Ad Article VI apply to the economy of any country, especially Russia.[201] Once Russia accedes to the WTO, were a Member to rely on Ad Article VI for the application against Russia of a dumping margin calculation methodology different from that prescribed in Article 2 of the AD Agreement, Russia could challenge this action before a WTO panel. A panel would find it difficult not to rule in *favor* of Russia, and such a ruling would in effect mean that the negative practical effects of being branded a non-market economy would no longer be an issue.

[198] According to The Tariff Act 1930, Title VII—Countervailing and Anti-dumping Duties, in the case of imports from a country which is not a Subsidies Agreement country (i.e., Agreement on Subsidies and Countervailing Measures ("WTO SCM Agreement"), no determination by the Commission of a reasonable indication of injury is required.

[199] *See supra* Part II(E).

[200] *I.e.*, no mention of the issue in the Protocol of Accession and application of the interpretative note Article VI of GATT.

[201] *See* Part II (H) *supra* on the government's involvement in trade in Russia.

I. Regional Trade Agreements with CIS Countries

In 1992 Russia concluded bilateral free trade agreements with the CIS countries,[202] exempting almost all CIS products from customs duties. On September 24, 1993 the CIS countries signed an Economic Union Treaty aimed at the creation of a common economic space. Later, in 1994, the CIS countries signed an Agreement Establishing a Free Trade Area.[203] The treaty provides for the creation of a common economic space with free movement of goods and future liberalization of services. Several additional agreements were signed by Russia, Belarus, Kazakhstan, the Kyrgyz Republic and Tajikistan aimed at the creation of a customs union.[204] These agreements were transformed into the Agreement Establishing the Eurasian Economic Community.[205] Initially, the parties intended to introduce a common tariff equal to the tariffs applied by Russia, but have so far failed to achieve this goal. It is not clear what approach will be taken regarding the introduction of the common customs tariff. Indeed, it would be difficult to introduce a single tariff in view of the very liberal commitments undertaken by the Kyrgyz Republic when it joined the WTO.[206] GATT Article XXIV:5 provides that:

> the duties and other regulations of commerce imposed at the institution of any such union or interim agreement in respect of trade with contracting parties not parties to such union or agreement shall not on the whole be higher or more restrictive than the general incidence of the duties and regulations applicable in the constituent territories prior to the formation of such union . . . .

Renegotiating the level of concessions with possible compensatory adjustment might not be a viable option.

III. Political Debate

A. Advantages and Disadvantages of Russia's WTO Accession

The additional GDP growth after Russia's accession is forecast at 0.6 percent per annum.[207] This figure, which might not be accurate, does not reflect all the advantages and disadvantages of accession. Advantages and disadvantages and the actual GDP growth rate will depend on the level of concessions undertaken by Russia and the state of the Russian economy at accession.

[202] The Commonwealth of Independent States was created in December 1991 and presently consists of Azerbaijan, Armenia, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russia, Tajikistan, Turkmenistan, Uzbekistan and Ukraine.

[206] NARAY, *supra* note 3, at 143. *See* WTO, *Protocol of Accession of the Kyrgyz Republic to the Marrakesh Agreement Establishing the World Trade Organization*, WT/ACC/KGZ/29 (October 23, 1998).

[207] ECONOMIC CONSEQUENCES OF ACCESSION OF RUSSIA TO THE WTO FOR THE NATIONAL ECONOMY 8, Russian Investment Council & Academy of Science of Russia (2002).

1. Advantages

One notable advantage of Russia's WTO accession will be improved market access for Russian exports. Although gas, oil and mineral resources account for almost sixty percent of Russian exports and face few trade barriers,[208] other industries have recently begun exporting.[209] Securing non-discriminatory market access for these new exports is important. Once Russia becomes a WTO Member, its exporters will be protected by GATT's non-discrimination provisions (MFN and national treatment). Although many countries have already granted Russia MFN treatment on a bilateral basis, as long as Russia remains outside the WTO, these countries are free to change their policy towards Russia. For example, in the United States, Russia's MFN treatment is subject to annual approval contingent on Russia's adherence to the Jackson-Vanik amendment to The Trade Act of 1974.[210] The revocation of the Jackson-Vanik amendment prior to Russia's WTO accession is desirable.[211]

EU expansion also poses problems for Russian exports. The EU accession of the Baltic and Central and Eastern European countries, some of which are of substantial export interest to Russia, is likely to worsen market access conditions for Russian exports. WTO rules require the EU to negotiate with Members damaged by the expansion of its customs union. Russia, as a non-member, will not be able to participate in such negotiations. Accession may provide the Russian government with a basis for addressing this issue.

Before Russia becomes a WTO Member, its trading partners are free to impose trade measures that are not consistent with prevailing multilateral, bilateral and regional agreements. Russia's trading partners already impose more than ninety discriminatory trade measures against Russia and the direct loss from such measures equals approximately

[208] *Id.* at 8.

[209] Russian exports include metals, timber, chemicals, fertilizers, anti-virus software and computer games, food products and beverages. Detailed information on Russia's exports and imports is available in English and Russian at http://www.russiaexport.net (visited November 14, 2003).

[210] The law, enacted during the Cold War, conditions normal trade relations with the United States on a country's application of a policy allowing the freedom to emigrate. On request from the Bush administration, Congress has recently started working on "graduating" Russia from Jackson-Vanik. *See* Jackson-Vanick amendment, codified at Title 19—Customs Duties, Chapter 12—Trade Act of 1974, Subchapter IV—Trade Relations with Countries Not Receiving Nondiscriminatory Treatment. The amendment states:

> Products from any nonmarket economy country shall not be eligible to receive nondiscriminatory treatment (normal trade relations), such country shall not participate in any program of the Government of the United States which extends credits or credit guarantees or investment guarantees, directly or indirectly, and the President of the United States shall not conclude any commercial agreement with any such country, during the period beginning with the date on which the President determines that such country–
>
> (1) denies its citizens the right or opportunity to emigrate;
>
> (2) imposes more than a nominal tax on emigration or on the visas or other documents required for emigration, for any purpose or cause whatsoever; or
>
> (3) imposes more than a nominal tax, levy, fine, fee, or other charge on any citizen as a consequence of the desire of such citizen to emigrate to the country of his choice.

[211] The MFN treatment extended by the United States to the Kyrgyz Republic after its accession to WTO remained contingent on the Jackson-Vanik amendment. This was possible due to invocation by the United States of Article XIII of the Marrakesh Agreement. *See* Drabek and Bacchetta, *supra* note 146, at 14.

US$3–4 billion per year.[212] WTO membership might reduce this loss by 30–40 percent.[213]

Non-membership exposes Russian exports to greater unpredictability on foreign markets. For example, as noted above, the United States does not apply an injury test in its countervailing duties investigations of non-member products.[214] After accession, trading partners would have to adhere to the rules established in the WTO Agreements relating to trade defenses. In addition, should these rules be violated, Russia would be entitled to launch a WTO dispute settlement proceeding before an independent panel and to appeal the decision of such a panel to the WTO's Appellate Body.

Russian consumers should also gain from Russia's WTO accession. Consumers will be able to obtain cheaper and higher quality products as a result of lower tariffs, greater transparency of laws and an increased inflow of investment, all of which are likely to result from Russia's accession. Related to this point, domestic industries should also gain from lower tariffs on products used as inputs in their production processes. Russia's growing economy requires increased imports of inputs and manufacturing equipment. These imports are necessary for improving the technology and quality of Russian exports. Development of varied and strong export industries is necessary if Russia is to diversify from being largely an exporter of natural resources and raw materials. Since these exports are subject to many external factors, including fluctuations in the international price of oil, the long-term welfare of Russia will not be stable until it diversifies.

For the effective development of competitive export industries it is also crucial that Russia attract investment capital to modernize its infrastructure. Most of Russia's industrial plants, equipment and infrastructure are obsolete.[215] Foreign investment should also mean increased employment, technology transfer, including the transfer of more western expertise and more efficient production and management methods. Although Russia has tried to attract investments through the creation of special economic zones and by offering preferential tax regimes for investors, this alone proved insufficient to attract major foreign direct investment ("FDI").[216] Tax exemptions are not the most effective instrument of investment policy.[217] Economic and political stability, transparency, legislative consistency and an effective dispute resolution system are crucial to attract FDI. Over the past decade, Russian laws and government regulations have been subject to unpredictable and drastic changes. Moreover, local governments have created complicated procedures that pose obstacles to foreign investors. Foreign companies have often complained about the inconsistencies between federal and regional regulations as well as the discretion exercised by local authorities. These factors have impeded Russia's economic development

[213] Economic Consequences of Accession of Russia to the WTO for the National Economy, *supra* note 207, at 9.

[214] *See supra* Part II(H).

[215] The average age of Russian industrial plants and equipment was 16 years in 1998. Bush, *supra* note 21, at 8.

[216] FDI in Russia between 1991 and April 2002 was approximately US$17.2 billion, compared with over $350 billion in China. FDI in Russia in 2000 was approximately $4.4 billion out of global FDI of $1,270 billion. In 2001 FDI in Russia declined to $4 billion and in first half of 2002 to $1.9 billion. Bush, *supra* note 21, at 6.

[217] Joel Bergsman, Harry Broadman and Vladimir Drebentsov, *Improving Russia's Foreign Direct Investment Policy*, in Russian Trade Policy: Reform for WTO Accession (Harry Broadman ed. 1999), at 67–68.

and impeded foreign investment. Studies show that investors are interested in countries that have a stable legal regime, provide secure market access opportunities and do not discriminate in favor of domestic companies.[218]

By cementing into place a more transparent and stable trade policy, Russia's WTO membership should increase its chances of attracting FDI.[219] Investors will be more willing to invest in Russia when it assumes international economic commitments. Undertaking international obligations provides a much greater degree of security for foreign investors than liberalization within the framework of domestic policy. In the latter case, investors might still be reluctant to invest as the domestic regime can easily be changed.[220]

Liberalization efforts that are not tied to WTO obligations are more susceptible to pressure from domestic commercial interests seeking protection.[221] Upon WTO accession, Russia will lock in a more liberal trade regime—undertaking WTO obligations should provide a first line of defense for the government against domestic protectionist pressure. This should also enhance Russia's economic development since a decrease in the ability of lobbyists to influence domestic policies should stimulate Russian producers to increase competitiveness.

Russia's accession should also result in a revision of its procedures governing registration, licensing, certification, and accreditation of companies. Such procedures now constitute a significant barrier to foreign companies operating in the Russian market. They are ambiguous, non-transparent and applied in an unpredictable manner, thereby leaving substantial discretion in the hands of various officials. Russian companies will also benefit from a streamlined and less arbitrary administrative system.

Russia's accession will also result in the partial liberalization of Russia's service sector. Greater international competition for the provision of services should enhance the competitiveness of Russian service providers, increase their efficiency, and result in an improvement in the scope and quality of services provided. This in turn should result in positive changes for Russian companies that are service consumers. For example, at present, the Russian loan market is not developed and to receive a loan on favorable conditions is difficult for Russian companies. The leasing system also needs to be developed to enable Russian companies to use equipment on favorable terms.[222] Liberalization of Russia's financial service sector should bring about increased competition which in turn should drive down prices and result in a more diversified range of offerings, thus providing additional opportunities for Russia's small and medium-sized businesses.

Accession would also allow Russia to participate in efforts to formulate international trade rules and, consequently, address Russia's interests in the ongoing and future rounds of trade talks. Russia's participation as a WTO Member in international trade talks would reduce the chance of decisions being made that are adverse to Russia's interests. If Russia completes its accession before the end of the Doha Development Round, it would be able to influence the results of this Round of negotiations.

[218] Bergsman, Broadman and Drebentsov, *supra* note 217, at 65, 67.

[219] Drabek notes that "the modest amounts of foreign investments in the Central and Eastern European region are generally attributed to the lack of credibility of trade and investment policies". [222] См. Биржа, *Нижний Новгород: Чего хотят крестьяне?* (28 *мая* 2002).

In conclusion, the indirect positive effects of accession may be as important as the direct gains in market access for Russian exports. WTO accession is crucial for Russia's overall reform process. In particular accession would advance institutional reforms, including the creation of the legal framework necessary for the further development of Russia's market economy. Equally important, accession would increase stability in Russia's commercial policy—one consequence of adherence to WTO rules and disciplines. Accession is crucial if Russia is to attract much needed investment, both domestic and foreign. Lastly, accession, and the reforms that would follow, would improve the efficiency and productivity of Russia's economy, and at the same time would enhance Russia's integration into the international economic and political system.

2. Disadvantages

While the above advantages certainly speak for Russia's accession to the WTO, there are a number of drawbacks and concerns that the Russian government must address in order to minimize the disadvantages of trade policy liberalization. One problem is that many Russian manufacturers are not ready to compete against cheaper and higher-quality foreign products.[223] In particular, sectors such as food, furniture, pharmaceuticals, metal, chemicals, automobiles and aviation could be hit particularly hard. As competition increases, it is likely that Russian unemployment will rise, due to bankruptcies of a number of companies. The government must determine which sectors are strategically important and merit protection.

Russia needs producers that are competitive on world markets; Russian industries cannot survive by supplying the domestic market alone. Russia's accession will stimulate Russian companies to intensify efforts to restructure and improve efficiency. Deserving industries that have not yet achieved international competitiveness may need initial protection from imports. Protection however cannot be for an indefinite duration. Industries that enjoy excessive government protection tend to be slow to develop and reluctant to forego state aid. Even industries that require a limited period of protection must be pushed to become competitive quickly.

It is wrong to argue that by binding all its tariffs Russia will not be able to protect its producers adequately. Russia is negotiating bindings that are well above applied tariff rates. Finally, in urgent cases, Russia could depart from the "bound"[224] tariff, by paying compensation through the grant of additional concessions in other areas, or by invoking safeguard measures.

One argument against accession is that customs duties, which now constitute a significant part of state revenue, will decrease because tariff rates will be lower and charges other than tariffs will be tightly restricted.[225] This may be true, but an increase in imports after accession should offset some of the revenue loss. Furthermore, an increase in tax proceeds resulting from Russia's continued economic development (which should be spurred by accession) should also offset this revenue loss and would be a more economically beneficial source of government revenue.

[223] Studies show that only 25 percent of producers are now competitive in the domestic market, and that only ten percent are ready for accession. *See* ECONOMIC CONSEQUENCES OF ACCESSION OF RUSSIA TO THE WTO FOR THE NATIONAL ECONOMY, *supra* note 207, at 11.

[224] WTO Members must undertake a commitment not to raise tariffs above certain negotiated levels or "bound rates".

[225] For discussion on effects of the WTO accession of transitional economies on their customs revenues, *see* Drabek and Bacchetta, *supra* note 146, at 19.

The service sector is concerned that in order for Russia to accede, Russia will need to open its service market substantially and that such measures would harm domestic providers. Apart from the fact that the precise level of Russian concessions depends on the result of the negotiations (and Members will not require the full liberalization of Russia's service market), in emergency situations, such as serious balance-of-payment problems or external financial difficulties, Russia would be able to depart from its obligations.

Nor is the argument that Russia would lose sovereignty over its economic policy convincing. Russia is already a signatory of many international and bilateral treaties that it must consider when deciding its economic policy. For example, Russia participates in the Energy Charter[226] and the Agreement on Partnership and Cooperation with the EU,[227] both of which contain provisions that are identical to provisions in the WTO Agreements.

Finally, while it is true that Russia's WTO Membership will require expensive government reforms, much of the needed reform is related to the professional development of Russian government officials.[228] This should have considerable benefit for Russia.

B. Perception of WTO Accession by the Russian Business Community

Although studies show that the Russian economy will gain overall from WTO accession, the position towards accession of particular industries and companies varies.[229] Large companies in developed sectors such as wood and paper and steel do not feel threatened by accession and are interested in the possibility of obtaining improved market access for their products. Many large companies are also interested in improved investment opportunities abroad and the liberalization of Russia's monetary regime which would follow accession. Companies in the energy and raw materials sectors are also in favor of accession, although their products encounter few barriers. For steel producers accession means revision of the existing trade remedy measures imposed on them, such as anti-dumping duties,[230] and stricter rules governing the imposition of future measures.

Russian subsidiaries of foreign companies are important proponents of accession because after commercial establishment in Russia, they continue to experience numerous problems associated with licensing, certification, registration, customs procedures, and foreign currency operations. Russian regulations related to the above procedures are being carefully scrutinized by WTO Members demanding full compliance with WTO norms before Russia becomes a Member. For these companies, accession means the reduction of protectionism, greater transparency and more equal treatment.

WTO opponents among Russian companies include the financial services sector (notably insurance), the telecommunications sector, some agriculture producers, and aircraft, car and television manufacturers. Russian producers in many segments of the food and drinks industry are also suspicious about WTO accession, fearing it would allow foreign suppliers to overwhelm the market with lower-priced products. For example, in spring 2002 Russian poultry producers urged the government to ban imports of American

[226] The Energy Charter Treaty is available on the website of the Energy Charter Secretariat at http://www.encharter.org/upload/1/TreatyBook-en.pdf (visited November 14, 2003).

[227] *See Agreement on Partnership and Cooperation*, *supra* note 100.

[228] Moreover, the WTO provides fully sponsored training programs for government employees.

[229] For detailed discussion of the opposition campaign of 2001, *see* Igor Bunin, *Russia's Accession to WTO: Domestic Policy Aspects*, MATERIALS OF THE 3RD INTERNATIONAL BUSINESS SUMMIT OF THE COMMONWEALTH OF INDEPENDENT STATES "DOING BUSINESS IN THE CIS-IMPLICATIONS OF WTO ACCESSION", EVIAN, FRANCE, (SEPTEMBER 30–OCTOBER 2, 2002), at 39.

[230] Selivanova, *supra* note 20, at 20.

poultry based on sanitary norms. Later in 2002, the poultry industry successfully lobbied the Russian government for a safeguard measure to protect domestic producers against all poultry imports.[231]

However, even in the traditionally protectionist drinks sector, some big companies such as Baltika breweries, are in favor of WTO accession. During a meeting with President Putin, the director of Baltika emphasized that non-membership in the WTO is a growing problem for sizeable Russian food producers.[232] This is because Russian food producers do not have parity in exports market, where otherwise they could be competitive.

Russian manufacturers in the aviation sector want the Russian government to secure a high level of protection for their industry in the accession negotiations. They have established the "International Union of the Aviation Industry" and given it the task of lobbying for the interests of domestic producers domestically and at the international level. Given the importance of this sector, the Russian government will strongly defend the interests of its aviation industry in the negotiations.

However, interested in the promotion of its own products on foreign markets, the Russian aircraft producers are concerned that they cannot compete with foreign manufacturers, even in areas where the technological level of Russian products is comparable, due to weak servicing and maintenance. For example, the director of the Sukhoi factory emphasized that due to the unfavorable conditions of access to foreign countries' markets, it takes Russian producers a month to make deliveries for the maintenance of their products. Therefore, they cannot compete with foreign producers that deliver maintenance services within 24 hours.[233]

As already noted, Aeroflot's status poses another difficult problem. Since the Soviet era, Aeroflot, has been receiving "over-flight fees" from all foreign airlines crossing Russian airspace.[234] In 2001 Aeroflot reported a profit of US$42 million, with income generated by over-flight fees of about $250 million.[235] If not for these charges, Aeroflot would have incurred huge losses. Trade partners such as the EU have used the accession negotiations to demand the elimination of these charges. If the conclusion of the accession negotiations is conditional on an agreement on the over-flight issue, Russia's accession to the WTO might pose severe financial problems for Aeroflot.

The interests of the economic elite will be affected by concessions made in the services sector. Domestic service providers have strong lobbies. These companies do not oppose accession *per se*, but insist on long transition periods for the phase-in of commitments. For example, Rostelecom, a monopoly telecommunications provider enjoys strong support in the Ministry of Communications. It is therefore probable that the Russian government will seek to protect the telecommunications industry in the accession negotiations until the bitter end. Russian insurance companies and some banks are also lobbying for long transition periods. The president of Sberbank supports protecting Russia's banking sector by restricting the activity of foreign banks during a transition period of at least ten years.[236] Moreover, he emphasizes that a decrease in state ownership of Russian banks

[231] *Id. See* Part II(B.1) and *supra* note 43.

[236] Денис Демьянов, *Андрей Казьмин оценивает вступление в ВТО*, Время МН (20 июня 2002).

should not be a goal, as some WTO Members have higher levels of state participation in the banking sector than that of Russia.[237] The Sberbank president is concerned that foreign banks have already managed to attract the "best" Russian clients.[238] Most Russian bankers are against the removal of limitations on the activities of foreign bank branches. The vice-president of the Association of Russian Banks ("ARB") recognizes the necessity of joining the WTO, but he emphasizes that the banking sector would need a five to seven year transition period.[239] He considers it reasonable to allow foreign banks to conduct business only after they establish a legal presence in Russia.[240] He also insists on a 15 percent quota for foreign capital in the banking sector with the option of increasing it to 25 percent.[241] Interestingly, small Russian banks are not opposed to WTO accession. Smaller banks are more concerned that the large banks, supported by the government, are becoming stronger and they see the large Russian banks as their real competitors.[242] Despite the strong interest that some Russian banks may have in protection, the issue may be whether foreign banks would be willing to risk their resources in the high-risk Russian market.

In the insurance sector, protectionist lobbies are even more active than in the banking sector. The general opinion in the industry is that liberalization should be gradual and that a transition period of five to seven years is necessary in order to protect the domestic industry from more powerful foreign companies that may use predatory prices in order to drive Russian insurance companies out of the market.[243] Domestic insurers also insist on reserving certain types of insurance activity for Russian companies, including life insurance, pension, and all types of compulsory insurance, which they view as crucial for Russia's social security system. Moreover, they want to exclude foreign companies from offering insurance related to government procurement activities, and state and municipal projects.[244] The General Director of ROSNO, a leading Russian insurance company, has however expressed a different opinion, stating that he saw no reason to limit foreign ownership of insurance companies or the types of services offered by foreign insurance companies.[245] He argues that even after fifteen years have elapsed, the turnover of Russian insurance companies will not be comparable to that of large foreign insurers such as AIG.[246] He believes that the Russian government should, instead, regulate the transfer of capital abroad by insurers active on the market.[247]

[247] *Id.*

The producers of furniture are quite concerned about increased competition and are lobbying for an increase in tariff protection.[248] At the end of August 2002, the Association of Furniture Producers presented to the government proposals related to an increase of tariffs. The proposal is primarily directed against IKEA,[249] which had managed to successfully lobby for a decrease of tariffs and special privileges as a strategic investor. However, Russian producers count strongly on foreign investments that would finance the development of furniture manufacturing. The producers believe they will need several years to attract investments and to start producing competitive products.

Although two years ago many business leaders in Russia were still opposed to WTO accession in general, the opinions expressed by domestic industry representatives show that WTO Membership is widely viewed as an opportunity for many sectors of the economy. While the most eager opponents of WTO accession still insist on prolonged transition periods, few now assert that Russia should not join the WTO at all, as was the case before.[250] However, according to a study carried out by the Russian Academy of Science, only 25 percent of Russian enterprises consider themselves ready to compete on the domestic market, 18 percent on the CIS market, 9 percent on other foreign markets, and only 10 percent of enterprises believe they are ready for WTO accession.[251]

IV. Expected Impact of WTO Accession on Specific Sectors of the Economy

In 2002, the Russian Academy of Sciences and the National Investment Council conducted a study on the impact of Russia's WTO accession on the Russian economy.[252] This study analyzed the consequences of Russia's accession on a macroeconomic as well as sectoral and territorial level. Import tariff changes served as the basis for a quantitative assessment of the accession's impact on the Russian economy. The study recognized that it is difficult to calculate the consequences of Russia's WTO Membership on the Russian economy, as there are many non-tariff methods of regulation that are not subject to quantitative assessment.[253] The study concluded that the optimal economic scenario is based on a smooth transition to liberalization.[254] This strategy lies at the basis of Russia's negotiating position, i.e., that Russia would not be obliged to adopt significantly lower tariffs immediately after accession and would do so only after a transitional period.

[251] Economic Consequences of Accession of Russia to the WTO for the National Economy, *supra* note 207, at 11. In 2001, the Ministry of Economic Development had over 260 discussions on the status of Russia's negotiations with numerous unions and producer associations. The Ministry for Economic Development and Trade has organized conferences with the participation of the Committee for Economic Policy and Entrepreneurship of the State Duma, Russian Union of Industrialists and Entrepreneurs, and other organizations. Starting from July 2001, a series of regional conferences "Russia, the WTO, and Interests of the Russian Business Community" have been held in more than twenty Russian cities.

[253] *Id.* at 13.

[254] *Id.* at 8.

In general, the study did not find that any significant changes would take place as a result of Russia's accession. The impact of tariff changes on the economy would not be considerable. The level of tariff protection in many sectors immediately after accession is likely to be higher than the current level.[255] The study also saw a possibility that due to import substitution, GDP growth might be insignificant—only 0.6 percent.[256] Such growth would depend on the final level of tariffs agreed between the parties.[257] The calculations showed possible growth would be in the clothes industry (1.6 percent); shoes (1.3 percent); TV-sets, (1.7 percent); alcohol (11.6 percent); poultry (12.4 percent); and grape production (25 percent).[258] There would not be any significant negative impacts on the macroeconomic dynamics of the country due to changes in import tariffs. Problems are most likely to arise in the food, furniture, pharmaceuticals, chemical, automobiles and aviation industries.[259]

The study also showed that for exports, accession would not have immediate effects, since two-thirds of exports are in the energy sector and do not face any exports barriers.[260] For other exports, the situation would not change dramatically, as Russia already has secured MFN treatment from its major trading partners. Accession will serve simply to ensure stability for Russian exports. One of the benefits for export industries will also be a review of trade remedy measures, first of all, anti-dumping duties, in accordance with WTO rules.[261]

It is much more difficult to calculate the consequences of Russia's WTO accession for its services sector.[262] Most Russian service providers are inferior to foreign service providers in terms of price, quality, diversity, etc. The dynamics of economic development in this sector depends not so much on WTO rules, but on the inflow of capital from both domestic and foreign investors.[263]

The regional benefits from Russia's WTO accession will depend on the involvement of particular regions in export activities. Export-oriented, developed, and frontier regions would be among those that would gain the most from accession.

A. Agriculture

Although Russia has immense land resources, due to its climate the conditions for agriculture are not favorable. In the 1990s, the domestic food industry was incapable of meeting Russia's demand in basic food products. In 1996, agricultural products represented 25 percent of imports and only 4 percent of exports. The share of agriculture in Russia's GDP declined from 15.4 percent in 1990 to 6.5 in 1997.[264] An enormous food deficit characterized those years. At present the biggest factories still depend on

[264] NARAY, *supra* note 3, at 132.

imported inputs for their finished products.[265] However, the Russian agricultural sector has substantial potential for development. In many regions, agricultural producers already receive profits; some even export their production.

Farm support is one of the most difficult issues in the negotiations and it is crucial in the assessment of the impact of WTO accession on Russia's domestic industry. Given the current level of subsidization, Russian agricultural producers are skeptical that they will receive the amount of support that is being requested by the Russian government in the WTO negotiations, and realize that they will have to cope without large subsidies.[266]

Accession to the WTO is important for the development of Russian agricultural exports. Russian exporters face sophisticated forms of protection in the markets of WTO Members. Producers have expressed interest in receiving governmental support other than subsidies: such as the harmonization of Russian standards with EU standards.[267] Furthermore, effective credit and leasing systems could facilitate a significant increase in exports.

In conclusion, if the final level of liberalization commitments does not differ substantially from those currently proposed by Russia, accession is unlikely to adversely effect the domestic agricultural industry. Accession should also have some positive effects for consumers: the availability and quality of products will increase, and prices are likely to be lower.

B. Industry

The level of tariff protection is crucial for Russia's developing **furniture** industry.[268] Depending on the agreed level of tariff protection, a significant increase of competition is possible in this sector. At the same time, Russian producers count strongly on foreign investments to finance the development of furniture manufacturing in Russia. In this respect WTO accession should be beneficial for Russian producers in this sector as there would be more stability for investors. Moreover, the European Federation of Furniture Manufacturers believes that Russia is one of the most promising countries for furniture production.[269]

The Russian **pharmaceutical** industry increased its market share from 30 percent in 1997 to 50 percent in 2001.[270] The domestic pharmaceutical industry seeks now to increase its share to 70 percent. The negotiations in this sector have slowed due to the contradictory positions of the parties involved. Presumably, Russia will have to lower the level of tariff bindings it has proposed to Members.[271] Therefore, once Russia accedes to the WTO, competition in the pharmaceutical sector is expected to increase, but Russian consumers will benefit from the quality of imported products and they will be able to

[271] *Id.*

choose between Russian and imported medicines. Competition should also decrease prices.

In the **chemical** industry, competition is likely to increase significantly. Russian producers will probably experience competitive difficulties for products such as paints, polishes, auto-cosmetics and motor oils.[272]

Russia's **steel** industry is one sector that will benefit most from WTO accession due to the expected review of anti-dumping duties imposed on Russian products by WTO Members. However, the managers of Russia's leading steel producers state that accession would not be beneficial if Russia has to increase significantly domestic prices for energy inputs, as some of Russia's counterparts in the negotiations request.[273]

Russian **automobile** producers are not competitive in the world car market and they are among the strongest opponents of WTO membership. In the automobile industry, the situation remains unclear as to what level of tariff protection Russia will be able to negotiate. If Russia manages to negotiate a high level of tariff protection, foreign producers may be better served by producing or assembling their products in Russia rather than importing them.[274] Foreign investment in the automobile industry might further the development of new products by Russian manufacturers. Also an inflow of investment would result in a transfer of technology and know-how. These are reasons why Russia seeks to increase its proposed level of tariff protection.[275]

The technological level of foreign **civil aircraft** manufacturers is deemed to be superior to that of Russian producers. Moreover, Russian-made aircraft do not meet current noise reduction standards imposed by the industrialized countries. Due to the lack of a market for Russian civil aircraft there are no real prospects for the development of new aircraft. The production of new models requires at least 100 orders to be viable.[276] In this respect, WTO accession is unlikely to result in substantial change for this sector.[277] Moreover, due to the global crisis in the aviation industry, prices for leased foreign aircraft are low making it affordable for Russian airlines to lease foreign aircraft.[278]

The experience of developed countries shows that technologically advanced and innovative industries are key elements for a country's successful economic development and growth.[279] Russia has strong potential in some high-tech industries such as space technology, information technology based on complex mathematical methods, computer programming, mineral exploration, atomic energy, and military equipment and machinery.[280] However, these industries have stagnated in recent years due to a decrease in government orders and lack of consumer demand.[281] Development of these sectors should be a priority in Russia which now specializes mostly in the export of resources.

[280] *Id.* at 72.

[281] *Id.*

Currently, Russia does not have many possibilities to export high-tech products, due to the inability of Russian-made products to compete on the world market. There is a strong argument that WTO Membership is not beneficial for Russia until such industries have developed to a competitive level. From this point of view, early WTO accession might result in the stagnation or disappearance of industries that are in the initial stages of development, since they might not be able to withstand competition from more technologically advanced and cheaper foreign products.

Russia is insisting on protection for its high-tech industries. Nevertheless, the reduction of import tariffs on machinery using new technologies, innovative products, and services would lower the costs of domestic production of complex technological products, which require the use of imported input and know-how. Finally, accession to the WTO would create improved conditions for the development of cooperation in the form of joint ventures and joint research.[282]

C. Services Sector

Any quantitative assessment of the impact of Russia's accession on the services market is difficult, as the market is subject to the influence of numerous non-price factors.[283] However, "by improving the investment climate and by providing the restructuring of key services sectors, participation in the GATS could make an important contribution to economic growth".[284]

The services sector did not receive sufficient attention under the Soviet system.[285] This sector mostly consisted of "services linked directly to production in industry, agriculture and mining" whereas financial services and professional services have never developed.[286] After the start of reforms, the most rapidly developing services sectors were banking, accounting services and retail services.[287] Since the beginning of the transition process, the services sector has been of growing importance for Russia's economy. The share of services in GDP increased significantly during the 1990s, amounting to 55 percent of Russia's economy in 1998.[288] However, many Russian services sectors are still in their initial stages of development and the industry is in dire need of resources.

The development of a domestic services sector is crucial for the reform process and the construction of a thriving economy. Indeed, an efficient services sector could enhance the competitiveness of Russian goods exports as well as lead to the export of services.[289] Russian hotels, shops and insurance companies, among other sectors, are infamous for their low quality. The Russian services sector is one of the industries where competition is particularly needed to improve quality. Russia's accession would mean that Russian companies would be able to get first-hand experience from developed country service providers which should result in an improvement in the level of domestic Russian services. With the appearance of foreign operators in the services market, there would be an inevitable transfer of technology. This transfer would raise the quality of services provided by Russian companies to international standards. Other positive results from increased

[287] *Id.*
[288] NARAY, *supra* note 3, at 140.
[289] Smith, *supra* note 26, at 32.

competition are likely to include a better and broader choice of services available to consumers, and a decrease in prices. With more competitive services, Russia's export of services should also increase. Currently, Russia does not export many services; the trade deficit in the services area is around US$7–8 billion.[290]

Domestic service providers fear the dominance of sizeable, experienced and well capitalized foreign service providers. However, the immediate expansion of foreign service operators is unlikely. For companies to start operating in the new market not only the overall trade regime, but also the investment climate and the potential of the market to generate profits are crucial. Improvements in the investment climate and in the predictability of government policy-making will not be immediate. Moreover, in some sectors such as banking, a dramatic increase in foreign competition is unlikely as most important foreign players have already established themselves in the market and the market is already saturated. In general, the services sector is subject to international competition to a lesser degree than the goods industries.[291] Indeed, cultural and language factors, as well as the physical presence of service providers, make it easier for domestic companies to establish themselves in the market. Russian companies have a substantial advantage as they are familiar with the environment and specific conditions of doing business in Russia. While some sectors will experience competitive pressure from the expansion of foreign firms in the Russian market, "in other services industries the impact of foreign competition will be limited."[292] Competitive challenges are more likely in those sectors, where capital requirements are substantial and there are significant economies of scale.[293]

After its accession to the WTO, Russia's services laws and regulations should become more transparent and predictable. Russian companies will benefit from these changes as well. In most services sectors, Russia is trying to obtain a transition period. Gradual liberalization will leave domestic service providers time to become more competitive and to attract more financing. Its services sector should also attract substantial investment.[294] "Infant industries" tend to remain undeveloped if given indefinite transition periods; but if domestic companies know that the transition period is limited they will improve their level of services more rapidly. According to a recent study, the likely positive consequences of Russia's liberalization of its service sector are even larger than those resulting from its liberalization of trade in goods.[295]

The specific situation in various sectors is analyzed below.

1. Telecommunications

Improving the efficiency of the telecommunications sector is important in a growing economy like Russia's. An efficient telecommunications sector is "critical to the competitiveness of industries ranging from petroleum production to financial services to computer software manufacturing."[296] However, weak infrastructure is a problem for this sector and it needs significant investment to upgrade its technological level.

Foreign telecommunications companies are eager to obtain improved market access to the Russian market. The position of the Russian government is to defend the right

to maintain the Rostelecom monopoly for five years after its WTO accession.[297] If, following accession to the WTO, the growth of the Russian economy and business activity increases, there would be a stronger market for telecommunications services. It would thus be beneficial for Rostelecom to keep its monopoly position during the period immediately following accession. Already, the telecommunications market is developing at an extremely fast rate; the potential for future growth is enormous.

The impact of WTO accession on Russia's telecommunications industry, and more specifically the position of the Rostelecom monopoly, depends on the final level of commitments that Russia must undertake. A short transition period preceding the liberalization of the market would force domestic companies to increase their efficiency.

2. Financial services

The financial services sector is "fundamental to Russia's economic performance and growth" and its restructuring is "a critical issue in the economic reform process".[298] Russia's accession to the WTO should stimulate the inflow of investment capital and this will prompt the development of the financial services sector. However, there is a big debate in Russia on the extent to which it should open this sector as the ability of Russian companies to compete with foreign service providers is questionable.

(a) Banking. Presently, the Russian banking sector lacks capital and most Russian banks are incapable of withstanding competition from prominent international companies like Citibank and Deutsche Bank. Perhaps the only banks that would be able to resist such competition are those supported by the government, e.g., Sberbank and Vneshtorgbank.

There exists real potential for the expansion of foreign bank activity in Russia, and such an expansion might undermine the position of Russian banks. Some risks associated with WTO accession include predatory pricing by foreign competitors and a decrease in capitalization due to the transfer of capital abroad. However, the threat from expansion of foreign banks should not be exaggerated. Major foreign banks have been operating in Russia since the mid-1990s. This did not prevent small Russian banks from finding their niche in the market.[299]

One of the indisputable advantages of an increase of activity by foreign banks in Russia is increased access by Russian industries and agricultural producers to the credit resources provided by such banks. Currently, the credit market is underdeveloped in Russia and successfully developing companies experience difficulty finding loans at favorable terms. This problem should not be overestimated since only developed, profitable businesses would be likely to receive loans from foreign banks. Nevertheless, the development of an effective credit market should be perceived as a long-term benefit.

[297] *See* Part II (D.3) *supra*.

[298] Smith, *supra* note 26, at 44.

[299] According to its bilateral agreement with the EU (Agreement on Partnership and Cooperation Establishing a Partnership Between the European Communities and the Russian Federation, *supra* note 100, Annex 7(A)), Russia has granted national treatment to subsidiaries (with up to 100 percent foreign participation) of European banks. Despite this factor, the presence of foreign capital in the market has remained quite limited compared to most countries in Eastern and Central Europe. For instance, in Moscow the share of foreign banks in operations with physical persons is twelve percent, and their share in corporate loans is fifteen percent. These rates may be due to the high risks and unpredictability of the political and economic situation. *See* Economic Consequences of Accession of Russia to the WTO for the National Economy, *supra* note 207, at 64.

(b) Insurance. The Russian insurance sector is presently heavily protected. The need for such protection is debatable in light of the inferior quality of service provided by domestic companies. In general, this sector does not attract long-term investment and does not accumulate capital inside the country, as Russian insurance companies keep their capital abroad through a reinsurance system.[300] It is also questionable whether foreign providers pose a competitive threat. This doubt is illustrated by the fact that after the removal of the 49 percent limitation on foreign ownership in Russian insurance companies, there has not been any increase in foreign activity in the market. The market share of foreign firms on the Russian market remains at about seven percent.[301] This is partially explained by the introduction of new restrictions on the types of insurance that foreign insurers are allowed to provide.

Foreign insurance companies would most likely not participate in direct insurance in Russia immediately after accession. One study shows that despite its growth, the Russian insurance market is not significant in terms of its share of GDP, capitalization of companies, level of demand for services, and volume of transactions.[302] It cannot be compared with the more developed market of Eastern Europe. The reasons for this underdevelopment are the lack of a tradition of insurance, the low income level of the population, and the low profitability of companies.

Based on the above, it seems possible that a solid deal in the insurance negotiations is not crucial for the expansion of foreign insurance companies into the Russian market.[303] This process is contingent instead on Russia's overall investment climate and economic development. Nevertheless, there are indications that Russia's WTO accession would play a positive role in the long-term development of Russia's insurance sector. It would increase capitalization of the industry; attract new methodologies and know-how, and a more diversified range of services.[304] The liberalization would be positive in terms of the improvement of quality and the reduction of service prices. Currently, Russian companies largely reinsure their risks abroad. Therefore, the arguments regarding lack of capitalization, used by protectionist lobbies, are not persuasive. The government will have to decide on the regulation of reinsurance and the transfer of capital abroad.[305] However, restrictions in this regard would only be possible if an effective credit and fund market develops.[306] Finally, the crucial question for development of this sector will be whether Russia restricts the activity of foreign insurance company branches on its territory. If foreign companies have the possibility to provide services through subsidiaries, the liberalization would result in an increase in investment.

3. Transport Services

Russian transport service providers demand a high level of protection. However, competition from foreign service providers is already high in this sector.

[305] Олег Вьюгин, *supra* note 300.
[306] Олег Вьюгин, *Защита для финансистов?* Ведомости (11 марта 2002).

Russian rail transport companies do not provide a high quality of service.[307] Cargo losses and slow service characterize this sector. After accession, there will be a liberalized transport regime and Russian rail transport companies will need to improve the quality of their services to remain competitive. Russian transport companies have an undeniable comparative advantage in terms of the knowledge of country-specific problems and business conditions.[308] Moreover, it is highly likely that foreign service providers will not enter the market immediately after accession.

4. Other Service Areas

Many Russian service providers have developed a level of services that is already competitive by western standards. This is the case for such areas as audits, consulting and computer services. Russian service providers are much less expensive than foreign service companies, and the quality is comparable, and sometimes even higher, as Russian companies know better the Russian-specific conditions of business.[309] In computer services, domestic service providers have found their market niche. They are successfully developing accounting and taxation, education, and search programs, electronic games and anti-virus programs. Some of these products, including electronic games and anti-virus programs, are being exported.[310] For many Russian companies, WTO accession would not have any adverse effects and, on the contrary, would mean improved export market access.

Foreign capital is important for development of the retail services sector. Notably, the industry spans the whole country, while so far only Moscow and St. Petersburg have attracted significant foreign investment in this area. With the entry into the market of foreign service providers, competition will significantly increase and Russian companies will not be able to obtain their current high-profit margins. For instance, the German retailer and wholesaler Metro now sells products with a price mark-up of 8 percent on the wholesale price, whereas Russian medium-sized shops have a 12–15 percent price mark-up.[311] The perception of Russian wholesalers and retailers are different; many Russian companies ask the government for protection, but others think that the market in this sector is huge, and that they will be able to find their niche. With the entry into the Russian market of big foreign wholesalers and retailers, small- and medium-sized Russian shopkeepers will experience problems, as more consumers will turn to large retailers for their shopping needs. This process has already begun.

Russia lacks a developed infrastructure to attract significant tourism. Although many tourist operators are currently on the market, they mostly provide services related to tourism abroad; tourism within Russia is not developed. Russia's accession to the WTO is important for the development of its tourism sector, which has an enormous potential. In 1999 Russia received only US$3.7 billion from tourism, which constitutes only 0.9 percent of the world export of tourism services.[312] Liberalization after WTO accession (bilateral negotiations in this respect are ongoing), will mean that foreign tour operators, most notably from Eastern Europe and the EU, are likely to enter the Russian market. This would result in a significant decrease in prices for tourist services.

[308] *Id.*
[309] *Id.* at 67.
[310] *Id.*
[311] *Id.* at 68.
[312] *Id.*

However, the threat to domestic service providers is not substantial as the market in this area is quite large and would develop further as more consumers enter the market, which is at this time not possible due to high prices. Tourism is an area that would benefit most from capital inflows. In the past, foreign investors have largely financed the construction of hotels in Moscow and St. Petersburg. So far, this construction has focused on higher-end accommodations. In the future, this process is likely to expand to other regions and also to medium-end hotels.[313] This change would stimulate the development of the tourism sector in Russia, which is now largely limited to Moscow and St. Petersburg.

The threats to the service sector from accession are definitely exaggerated and driven by protectionist lobbies. The development of a competitive services industry is important for the Russian economy. Therefore, although some industries would need a certain degree of protection, this level of protection and the length of an eventual transition period should be carefully balanced against the general development of a services industry.

In the long-term, the services market in Russia would benefit from WTO accession. Capital inflows and increased investment would facilitate its development. As for domestic service providers, they would inevitably face increased competition and many companies would have to increase efficiency or face bankruptcy. Nevertheless, the market is so large that in many areas, domestic service providers will be able to occupy a certain niche.[314]

D. Labor Market

Accession to the WTO and a liberalized regime for foreign companies and products are often associated with increased unemployment due to the bankruptcy of inefficient domestic companies. According to forecasts, the unemployment rate might increase in some sectors by up to twenty percent.[315] Russian officials estimate that its WTO accession might result in unemployment of up to 10 million people.[316] The increase in unemployment due to trade liberalization is difficult to calculate, as many inefficient producers will have to restructure in any event. For instance, it is estimated that the forthcoming restructuring of the steel industry will result in 350,000 job losses.[317] The number of job losses due to companies going out of business is significantly lower than the number of people that will quit voluntarily—due to low salaries which make the economic difference between being employed and unemployed less distinguishable.[318] However, due to an increase in foreign investment and the increase in economic development that should result from Russia's accession, employment opportunities in Russia should, in the long-run, increase. The entry into the market of foreign companies and service providers will also have a positive effect on the labor market in terms of an increase in the pay of Russian employees.

[313] *Id.* at 69.

[314] For instance, currently, in some areas foreign companies specialize in the provision of services to foreign clients and do not work with Russian companies. This situation has however started to change. For example, large Russian companies are now starting to use the services of foreign consultants and law firms.

V. The Impact of Russia's Membership in the WTO on the Multilateral Trading System

The accession of Russia to the WTO would strengthen and further enhance the multilateral trading system, which cannot truly be called "global" whilst Russia remains outside. After the accession of China in 2001, Russia is now the largest country outside the WTO. Apart from the systemic impact Russia's accession to the WTO would have on the whole trading system, many Members view Russia as an export market with significant potential. Over the past decade, companies from different countries around the globe have found Russia to be an attractive market for investment. Many of these companies later withdrew from Russia after experiencing enormous difficulties in doing business there. However, a market of 170 million consumers represents a substantial export market for many companies. Being an extremely large country, and rich in both raw materials and qualified human resources, Russia has substantial potential for attracting both categories of investors: those who are interested in producing goods in Russia and supplying to the Russian market, as well as those intending to export the products they manufacture in Russia. Therefore, changes in Russia's trade regime and economic policy, which will result from its eventual accession are of great significance to many Members.

Bureaucracy, corruption, complicated administrative procedures, a complex tax system, the lack of an effective dispute resolution mechanism and an inefficient judicial system, a lack of stability and predictability within the regime and the ineffective protection of property rights are cited among the problems which limit the flow of foreign investments into Russia. However, over the past few years the international image of Russia has vastly improved. Political stability and the government's emphasis on the need for reform, and ever more concrete actions to implement such reforms, have led to a greater interest in Russia on the part of foreign companies. Russia's effort to accede to the WTO serves as an external mechanism to speed up its reforms and one can already see the positive results of such reforms. However, until its accession process has been completed it is impossible to discuss the security and predictability of Russia's trade regime. Only legally binding international commitments would secure market access for foreign companies.

Foreign companies already operating in Russia are supportive of a speedy Russian accession to the WTO. Evidence of this is shown in the efforts made by foreign companies, presently in Russia to facilitate the accession process, which argue that the EC and the United States should grant Russia market economy status.[319]

Another important benefit for WTO Members is the possibility of lodging complaints before the WTO Dispute Settlement Body about trade restrictive measures taken by Russia. As long as Russia remains outside the multilateral trading system, very little can be done to reverse unfavorable Russian trade practices and policies towards foreign companies within and outside Russia. Of course, a certain degree of political pressure could help in solving trade disputes, but this goal is not easy to achieve if the restrictive

[319] The American Chamber of Commerce in Russia played a significant role in support of Russia's effort to secure for its imports equal treatment with other developed countries. For instance, AmCham filed an extensive legal brief and testified in favor of granting Russia market economy status at the International Trade Administration's public hearing. AmCham works to impress upon the government negotiators that Russia should be treated as fairly as possible. Moreover, Russia may need some form of protection, consistent to that given to other countries in the past, in view of its rapid transition to a market economy over a very short period of time (Interview with Andrew B. Somers, President, American Chamber of Commerce in Russia).

measures are taken by a large economy and a significant player in world politics, like Russia.

VI. Conclusion

Smaller countries usually find the process of WTO accession easier than larger economies.[320] Perhaps this is explained by the fact that, firstly, small countries cannot afford a protectionist regime in the same way as larger countries can;[321] and secondly, that Members tend to make more demands on larger economies acceding to the WTO in order to gain maximum benefit from the liberalization of market access. However, the majority of countries have experienced delays in all stages of the accession process.[322] It is true that in the case of any country's accession to the WTO, especially a large country like Russia, many interests are involved. While generally the accession of a country to the WTO may be of paramount importance to the national interests of WTO Members, and in the case of larger countries to the operation of the international trade system itself, "accession cannot occur until the particular commercial interests in all countries are satisfied."[323]

It is also true that the process of adopting new, WTO-compliant legislation, and the creation of institutional capacities, are the most time-consuming and technically difficult tasks that acceding countries must tackle. However, Russia has already adopted its major legislation in conformity with WTO norms. Now the question lies in the systematization and repeal, where appropriate, of numerous instructions of ministries and other governmental agencies in order to bring these regulations into compliance with new legislative norms.

It is difficult to predict when Russia's accession negotiations will be completed. Russian negotiators have underscored the position that the terms and conditions of Russia's accession must be based on the so-called standard WTO requirements, i.e., only on the rules and provisions of the multilateral trade agreements of the Uruguay Round. Moreover, it has been emphasized that accession terms should be based on a realistic perception of the Russian economic situation, and ensure the necessary protection for national producers while fostering an adequate competitive environment. It is possible that, due to new difficulties which constantly arise in negotiations, the process might be significantly delayed. Russian negotiators claim that new, additional, non-standard requirements, which have never been presented to other countries, continue to appear.[324] Russian officials have asserted that requirements for Russia are much higher than before,

[320] Michalopoulos, *supra* note 67, at 26.
[321] *Id*.
[322] *Id.* at 27.
[323] *Id.* at 32.
[324] Discussions on the accession process were held on a number of occasions, for instance, at the Ministerial Conferences in Singapore in 1996, in Geneva in 1998 and in the General Council on December 10, 1998. The positions of Members on terms of accession differ. Some Members indicate that Article XII placed no limits on the terms, which were to be developed through negotiations with current Members. Many Members say that the accession of new governments should strengthen the system, not weaken it, and that acceding governments must demonstrate their willingness to comply fully with the WTO rules upon accession. Interestingly, some speakers stressed that acceding governments should not be asked to undertake more stringent obligations than present WTO Members (so-called "WTO-plus" obligations) as it would be an abuse of economic power. *See* WT/ACC/7, *supra* note 25.

especially during the Uruguay Round.[325] However, other countries, which have recently joined the WTO faced similar demands. This new situation, however, does not mean that the conditions of accession should not take into account special situations related to the transitional nature of the economy.[326] Time is needed to introduce WTO-consistent economic strategies and implementation mechanisms. Commitments that ignore existing macroeconomic instabilities, and poorly developed economic, legal and social institutions cannot be sustained. It is not in the interest of Members to impose unsustainable obligations on Russia. The objective should be to reach terms of accession that provide for a substantial but sustainable degree of liberalization.[327]

It is in Russia's interest to complete the negotiations as soon as possible in order to participate as a full Member in the Doha Round of negotiations, which encompass many areas of crucial importance to the country. However, the number of outstanding issues remains large and agreement must be reached on the most controversial of them. While in the past Russian politicians specified the timeframes they sought for the conclusion of the negotiations, recently they have put greater emphasis on the acceptable terms of accession, no matter how long it takes to reach agreement on the right conditions. It is possible that this approach is due to the opposition, which still exists from some industries, to Russia's early accession to the WTO, as well as due to the Russian presidential elections to be held in 2004.[328]

Prior to the beginning of the Doha Round it was emphasized that if Russia does not succeed in completing negotiations before the Round begins, its accession might be delayed for several years. The Round has begun and it is still conceivable that Russia could accede during the Round, but it will be difficult, especially since the focus of attention will shift to multilateral negotiations.[329] Therefore, much will depend on the willingness of Members to divert some of their attention to Russia's accession during the ongoing trade talks.

[325] Statement of President Putin, October 2, 2001, PRIME-TASS Information Agency, Brussels: Russia "will accede to the World Trade Organization only on standard conditions and does not agree with the requirements presented that no other candidate-country faced".

[326] During the meeting of the General Council on December 10, 1998 it was generally recognized that "the balance in each accession was to accommodate the special situation of the acceding government on the one hand, and to maintain the credibility of the WTO system on the other". *See* WT/ACC/7, *supra* note 25, at 5.

* Barry Desker is the Director of the Institute of Defence and Strategic Studies, Nanyang Technological University, Singapore, and he was the Chief Executive Officer, Singapore Trade Development Board from 1994–2000.

I. Introduction

In a statement at the commemoration of the fiftieth anniversary of the GATT during the Second WTO Ministerial Conference in Geneva on May 19, 1998, Goh Chok Tong, Prime Minister of Singapore stated, "The GATT and an open multilateral trading system have enabled nations to compete peacefully without the need to resort to wars in order to carve out trading empires to keep out economic rivals. The WTO must now carry this responsibility. It can do so successfully if it is clear on what it can and should achieve in pursuing its fundamental objective of multilateral trade liberalization". Singapore has been a strong systemic supporter of the WTO and a consistent advocate of multilateral trade liberalization.

Trade is Singapore's lifeblood. With a tiny domestic market, the world has become Singapore's hinterland and market. Imports and exports account for three hundred percent of Singapore's GDP. Since 1979, total trade has grown approximately seven times, reaching a total of S$470 billion (equal to approximately US$272.6 billion) in 2000. For a country so plugged into the global economy, maintaining an open international trading system is fundamental. Singapore therefore places a high priority on the strengthening of multilateral trading institutions.

II. Singapore's Accession to the GATT

Singapore joined the GATT in 1973. This marked an important point in Singapore's economic development, and the arrival at that decision was due to both political and economic circumstances.

In 1963, the United Nations Bureau of Technical Assistance, which conducted an Industry Survey Mission to assess the economic situation in Singapore, was highly pessimistic about the prospect of an expansion of international trade in meeting Singapore's need for economic growth. Influenced by the Prebisch-Singer hypothesis[1] of the secular decline in the terms of trade of developing countries, the Mission suggested that the Singapore economy could stand on its own. It recommended an expansion in manufacturing to solve the unemployment problem, which arose from a rapidly growing population shaking off the colonial atmosphere marked by financial stringency and decaying infrastructure.

Hence the political leadership in Singapore followed the conventional wisdom among post-colonial states of embarking on an import-substitution strategy to promote industrial development. There was a temporary abandonment of the principle of free trade on which the city's entrepot economy had been based since its foundation, in favor of import tariffs and quotas to provide protection for "infant industries".

This period of import substitution was however, short and mild. Such a policy was obviously constrained by Singapore's entrepot tradition, the high degree of import dependence and the very small size of the domestic market. After political separation from Malaysia in August 1965, the industrialization strategy shifted rapidly to emphasize export development and labor-intensive manufacturing instead of import substitution within a Malaysian common market. A Malaysian hinterland and dependable market was no longer viable as the Malaysian government closed its market to preferential access for Singapore-made goods.

[1] The Prebisch-Singer hypothesis contended that there is a structural tendency for the terms of trade of developing countries to deteriorate because of the concentration of their exports in primary commodities. Advocates of this hypothesis support import-substituting industrialization for the developing countries, with high import tariffs and protection of infant industries.

The only alternative was clear: industrialization aimed at manufacturing for export to world markets. Enterprises producing for export would have to be efficient enough to meet competitive prices in foreign markets. Export-growth strategies were pursued vigorously. It was therefore a matter of pragmatically adapting policy to changing equations. The new outward-looking development philosophy and strategy, conditioned by Singapore's small size, geographical location astride major international shipping and air routes, traditional entrepot role, and historical immigration in response to the free trade opportunities of the nineteenth century and early twentieth century, yielded rewarding results.

This export-led growth was helped by an expanding world economy unfettered by restrictions on trade and investments. Liberalization of trade in the developed countries through the Kennedy Round, and concessions attained as a developing country through the Generalized System of Preferences, also helped to ensure market access of Singapore-made products. Openness to foreign investment and international trade at a time when other developing countries emphasized import substitution, restrictions on foreign investments, and tight foreign exchange controls resulted in Singapore emerging as a favored destination for investment by multi-national corporations.

The 1973 oil crisis however, had a dampening effect on Singapore's rapid economic growth. The GDP growth rate fell from 11.5 percent in 1973 to 4.1 percent in 1975. Singapore's export strategy had made the economy more vulnerable to the worldwide recession. Rising protectionism in the leading industrialized countries, restrictions on imports of textiles, clothing, footwear and electronics (the growth industries for Singapore in the early seventies), and unfavorable changes in Singapore's terms of trade aggravated the problems.

Accession to the GATT was therefore viewed as valuable in ensuring market access into key international markets. It was a brief and relatively painless process—essentially the only Agreement that needed to be implemented was the GATT 1947. Singapore's regime with respect to trade in goods was already liberal, with the general absence of trade restraints or restrictions, so that it had to make few concessions in order to join. Singapore elected to join as a developing country and participated in the Group of 77.

The Tokyo Round was Singapore's first direct (albeit limited) involvement in multilateral trade negotiations. Like other developing countries, Singapore supported the demand for more favorable treatment for developing countries, including an exemption from the need to reciprocate tariff concessions by developed countries. However, this outcome enabled developed countries to entrench GATT-inconsistent policies, for example, in textiles, which discriminated against imports from Singapore and other developing countries. It also allowed the developed countries to maintain higher duties on items of export interest to the developing countries, including Singapore.

Singapore established an office of the Permanent Representative to the United Nations in Geneva in 1973 to handle the UN agenda, multilateral trade negotiations and export promotion. Exposure to the Tokyo Round negotiations demonstrated to Singapore the significance of GATT negotiations and the importance of effective representation in Geneva. It was only at the completion of the Tokyo Round in 1979 and the subsequent implementation of the MTN agreements that Singapore commenced active participation in GATT. By the 1982 GATT Ministerial Meeting in Geneva, Singapore had already gained such respect as a trading nation and as a participant in the GATT negotiating process that Singapore was invited to be a member of the informal "Green Room" consultations. As a member of the Green Room, Singapore was actively involved in the Uruguay Round negotiations.

III. Participation in the Uruguay Round

A. Background

The failure of the 1982 GATT Ministerial Meeting brought on a determined drive by major developed countries to launch a new round of multilateral trade negotiations. The intention was for this new round (the Uruguay Round as it was known subsequently) to include new areas such as services, as well as to bring greater discipline to agriculture. Taken together with the traditional tariff and non-tariff liberalization issues as well as issues of interest to developing countries, the agenda for the proposed new round was more complex than in previous trade rounds, and hence more difficult to agree on. In particular, the inclusion of services, which was pushed by the United States, was seen by many developing countries as a new unexplored area. It was also an area in which developing countries saw little benefit, given their preoccupation with traditional market access for their goods such as textiles. On the other hand, without the inclusion of services, the new round was a non-starter for the United States.

With the expected slowdown in the global economy and possible rise in protectionism in the mid-1980s, Singapore supported a new round of trade negotiations. At that time, Singapore was also experiencing its first post-independence recession. The need to keep the liberalization of trade moving forward was imperative for Singapore whose dependence on trade was substantial. Failure to agree to negotiate was seen as likely to lead to backsliding of market access commitments, especially by the OECD countries.

From Singapore's point of view, the inclusion of services was not a problem *per se*. Their inclusion would be without prejudice to the negotiations, once the new round was launched, and to the position of GATT member countries. The battle would be during the negotiations. This was a different position from that taken by some of the major developing countries which opposed the inclusion of services. On the whole, Singapore considered that the proposed new round, with the inclusion of agriculture, clarifications with respect to trade remedies, and issues of interest to developing countries, would be beneficial to all. The range of issues for negotiation provided opportunities for trade-offs as successful negotiations required a package deal approach.

With this objective in mind, Singapore took the lead in bringing together a small group of developing countries to negotiate a draft Joint Ministerial Declaration with the OECD countries. Active in this group were all the ASEAN countries, as well as the Republic of Korea, Argentina, Colombia, Chile, Uruguay and Mexico. The draft formed the basis for the Uruguay Round Declaration at Punta del Este, Uruguay, where ministers from all the GATT member countries met in September 1986. Several important developing countries such as India and Pakistan were not initially in favor of a new round. However, they eventually joined in the consensus to launch the Uruguay Round.

B. Singapore's Policy Goals in the Uruguay Round

The Uruguay Round ("UR") negotiations were a major exercise aimed at expanding the major provisions of the GATT and the Tokyo Round Agreements, and eradicating the existing shortcomings of the trading system. These shortcomings included continued high tariffs in industrial products, including tariff peaks and tariff escalation, increasing application of non-tariff barriers, the exclusion of agriculture from the GATT disciplines, the exclusion of textiles and clothing from the "normal" GATT rules and the negative impact of the Multi-Fibre Arrangement, and the weak dispute settlement machinery.

The negotiations were also intended to counter growing protectionist pressures in the developed countries, especially in the United States.

Singapore participated with the overall intention of further liberalizing global trade and ensuring strengthened rules governing the conduct of such trade. This was essential to protect Singapore's interests as a small nation heavily dependent on a free, open and stable international trading system, which would prevent unilateral protectionist actions by trading partners. Like other committed free traders, Singapore believed that it was essential to maintain the momentum in favor of further trade liberalization if the multilateral system was to avoid the roll back of concessions because of domestic political pressures.

Singapore's main policy objectives in the UR negotiations were:

- to secure benefits from the market access negotiations
- to enhance transparency in global trade transactions
- to ensure that rules in new areas, i.e. services and TRIPS, would provide a predictable and legal environment conducive to world trade expansion
- to improve the dispute settlement system so that it would become more effective in resolving trade disputes

C. Outcome of Negotiations

1. Market Access Commitments

Singapore committed in the Uruguay Round to increase its tariff bindings from almost none to seventy percent of all tariff lines in the industrial and agricultural sector, binding at zero rate in sectors such as agriculture equipment, construction equipment, steel, pharmaceuticals and furniture and medical equipment. The average bound rate of industrial tariff lines was approximately 5.1 percent. Agriculture tariff lines, with the exception of tobacco and liquor products, were bound at a ceiling rate of ten percent.

In services, Singapore's schedule of commitments covered 61 sectors, including a revised schedule on financial services.

2. Market Access Outcomes

Some of the most significant market-opening measures affecting Singapore resulted from post-UR negotiations. The Information Technology Agreement ("ITA I") was concluded during the first WTO Ministerial Conference held in Singapore in December 1996. ITA I resulted in $1.49 billion of accumulated tariff savings for Singapore-based companies when the elimination of tariffs was fully implemented by January 1, 2000. ITA I covered five main categories of products, namely, computers, telecommunications products, semiconductors, semiconductor manufacturing equipment and scientific equipment. The conclusion of these negotiations at a major conference in Singapore that directly benefited Singapore-based companies reinforced domestic political support for the WTO process. As electronics exports comprised 68 percent of non-oil exports in 1999, Singapore actively supported ITA II negotiations aimed at extending product coverage, given the rapidly changing technologies and the convergence of consumer electronics with other inter-active multi-media products. However, progress in negotiations has been slow. Singapore also played an active role in supporting a political declaration at the second WTO Ministerial Conference in Geneva in May 1998 that provided for zero tariffs on electronic commerce.

At the close of the UR, market access negotiations in four key services areas—financial services, movement of natural persons, basic telecommunications and maritime transport services—were extended as key participants were dissatisfied with the level of market-opening measures. As a demander in the area of maritime transport services, Singapore was disappointed with the decision in June 1996 to suspend negotiations until 2000. However, Singapore demonstrated its commitment by reinstating its 1993 offer, which allows market access to ships calling at Singapore. As the movement of natural persons is a very sensitive domestic issue in most states, there was little progress in this area when the negotiations were concluded in 1995.

The Agreement on Basic Telecommunications entered into force in February 1998. Two key aspects of this agreement are commitments by many participants to (i) allow infrastructure-based international competition, i.e. to allow foreign companies to build and operate their own hard facilities, and (ii) apply pro-competitive rules in their telecommunications markets. Singapore committed to liberalize its local and international basic telecommunications on a facilities basis from April 2000. Singapore also committed to grant two licenses in 1998 for the provision of these services in the year 2000. For Singapore, the liberalization of global telecommunications markets also facilitated the international expansion of Singapore's telecommunications providers.

The Agreement on Financial Services came into force in March 1999. The combined commitments of the seventy participating governments cover an estimated 95 percent of global financial services activities. Singapore's commitments included the relaxation of restrictions on the commercial presence of foreign financial service suppliers, and the reduction of existing limitations on the types and range of services opened to foreign financial service suppliers. The wide coverage of these liberalization measures under the Agreement provides significant overseas market access for Singapore banks and financial institutions.

D. Success in Achieving Uruguay Round Goals

Singapore regards the overall results of the Round and the establishment of the World Trade Organization as positive. The Uruguay Round Agreements have enabled GATT/WTO rules to adapt to changes in the international trading environment, for instance, in setting up the new framework governing the significant expansion of trade in services. The wide-ranging agreements renewed confidence in the multilateral process, fostered the integration of the developing countries in the global trading system and diminished pressures for unilateralism, especially in the United States.

Faithful implementation of WTO commitments by member countries also resulted in improved market access for Singapore's goods and services. The official estimate was that US$333 million of accumulated potential tariff savings would result from Singapore's exports to its major markets. The conclusion of the negotiations in financial services and basic telecommunications reinforced unilateral liberalizing initiatives in Singapore aimed at improving Singapore's global competitiveness.

However, it was observed that there were two drawbacks from the perspective of the multilateral trading system. First, despite expanded rules on trade remedies, there has been an increase in the use of anti-dumping and safeguards measures as additional trade protection instruments. Secondly, a number of developing countries, especially the least developed countries, have yet to derive real economic gains from the UR agreements while facing immediate costs of implementation as a result of the regulatory provisions of the UR agreements.

IV. Effect of GATT/WTO Membership and the Uruguay Round on Singapore

A. Economic Effects

As a small economy highly dependent on trade, the open and rule-based multilateral trading system created by the WTO has contributed vitally to the economic well-being of Singapore. It is the most trade-dependent economy in the world, with a trade to GDP ratio of approximately three to one. Singapore is therefore reliant on the WTO to ensure that sound multilateral rules protect against discriminatory bilateral or unfair unilateral trade measures, such that Singapore's traded goods and services can flow freely with minimum impediment.

Within this necessary stable multilateral framework, Singapore benefited significantly from the reduction in tariff barriers through the numerous GATT rounds, which has provided increased market access and trading opportunities for its goods and services. The existence of a strong legal system and the implementation of WTO agreements on intellectual property rights attracted multi-national corporations specializing in the pharmaceuticals, biotech and electronics industries to develop manufacturing and research platforms in Singapore.

B. Political Effects

Active participation and support of the GATT and WTO has enhanced Singapore's stature as a respected player in these forums. The successful hosting of the inaugural WTO Ministerial Conference in December 1996 also contributed to sealing Singapore's presence in the annals of WTO history. The consultative process adopted by Singapore in preparing for the Singapore Ministerial Conference prepared the way for effective negotiating outcomes during the Conference as a wide range of views were canvassed and likely solutions tested with a range of participants in the WTO. The decision to adopt the logo of the Singapore Ministerial Conference as the logo for the newly established WTO is emblematic of Singapore's role in contributing to WTO processes.

From the GATT/WTO perspective, Singapore was perceived as a strong supporter of the multilateral trading system. Singapore supported the strengthening of WTO institutions, including the creation of an effective secretariat, the enhanced role of the WTO Director-General, the establishment of the General Council with strengthened powers and the establishment of a dispute resolution machinery with effective powers. The Permanent Representative of Singapore, K. Kesavapany, was the first Chairman of the General Council after the establishment of the WTO in 1995 and played an instrumental role in the informal consultations leading to the selection of the first WTO Director-General, Renato Ruggeiro of Italy. Kesavapany also secured the unanimous support of the General Council for Singapore's offer to host the inaugural WTO Ministerial Conference.

C. Social Effects

There were no direct social effects resulting from Singapore's GATT accession. Singapore's economic strategy has never been based solely upon openness to trade, but has encompassed, *inter alia*, the creation of necessary infrastructure and systems and the embracing of technological change to support an overall modern economy. The GATT processes were therefore crucial but not unique to Singapore's economic development. The focus of the Singapore Government was on educating the domestic public and encouraging an adaptation to new international environments. The domestic changes

arising from the implementation of the UR agreements, including the implementation of TRIPs, TRIMs and the Agreement on Textiles and Clothing, was hence never attributed to forced acceptance of GATT/WTO institutions.

D. Legal Effects

Singapore has not encountered much difficulty with bringing its legislation into conformity with the WTO Agreements. The legislative changes were considered necessary to ensure adherence to Singapore's GATT/WTO obligations and responsibilities as a signatory.

The most significant legislative changes for Singapore arising from the Uruguay Round were in the area of the protection of intellectual property. Ten laws were passed covering copyright, trademarks, geographical indications, layout-designs of integrated circuits and test data. With the promulgation of these laws, Singapore fulfilled the commitments that it undertook to implement the WTO Trade-Related Intellectual Property Rights Agreement by January 1, 1999, one year ahead of the WTO deadline.

TRIPS Compliance Legislation

Legislation	Passed as Law on
Medicines (Amendment) Act	February 19, 1998
Copyright (Amendment) Act	February 19, 1998
Copyright (Amendment) Regulations 1998	February 19, 1998
Copyright Tribunal (Procedure) (Amendment) Regulations 1998	February 19, 1998
Copyright (International Protection) (Amendment) Regulations 1998	February 19, 1998
Copyright (Border Enforcement) Regulations 1998	February 19, 1998
Trade Marks Act	November 26, 1998
Trade Marks Regulations	November 26, 1998
Geographical Indications Act	November 26, 1998
Layout Designs of Integrated Circuits Bill	January 15, 1999

V. Present Attitude of Citizens, Businessmen, and Political Leaders Towards the WTO

The WTO is perceived in Singapore as a necessary institution to ensure open global markets. The population has always recognized Singapore's limited resources, which necessitates increased external economic linkages. Because of Singapore's dependence on international trade, openness to foreign investment and commitment to the strengthening of multilateral institutions, there is strong domestic support for multilateral institutions such as the WTO. The openness of Singapore to external influences results in a positive attitude towards the globalization values advanced by the WTO and other international organizations. This positive reaction was seen during the first WTO Ministerial Conference held in Singapore in December 1996, which was successfully organized with the strong backing of its political leaders, businessmen and citizens.

There are no strong institutional interests in Singapore opposed to globalization and the expanded jurisdiction of multilateral economic institutions such as the WTO. Participation in WTO negotiations has not been a domestic political issue. The business

community is closely consulted on developments in the WTO and is represented on the Boards of the major economic agencies such as International Enterprise Singapore (the former Singapore Trade Development Board) and the Economic Development Board. The trade union movement has been supportive of trade liberalization as it recognizes that Singapore has benefited from the expansion of international trade. Unlike trade unions in the West, the National Trade Unions Congress of Singapore has opposed the inclusion of labor standards on the WTO agenda as such measures would undermine the comparative advantage of the developing countries.

VI. Strengths and Weaknesses of the WTO From Singapore's Perspective

Singapore believes that the WTO continues to be an important institution that sets the rules for and enshrines the mandate of ensuring unfettered trade flows, which enhance global prosperity. The multilateral character of the WTO enables trade-offs during negotiations and the crafting of win-win solutions. The GATT/WTO has achieved much in eliminating trade barriers, particularly tariffs. The tremendous challenge for it is to continue to achieve overall trade liberalization, in the light of pressure from increased accessions, socio-political sensitivities and objections, loss of confidence from developing countries, and the consequent difficulty in gaining consensus. There will be increasing pressure on the WTO to fulfill the competing objectives of promoting global trade liberalization and strengthening the global regulatory environment.

From Singapore's perspective, the establishment of the WTO was a major development in the creation of a global economic architecture. While the GATT was a set of rules, the WTO is an institution with a permanent secretariat. While the GATT was applied on a provisional basis, WTO commitments are permanent. They apply to trade in services and trade-related aspects of intellectual property as well as merchandise trade. The "package deal" approach resulted in most commitments involving the entire WTO membership.

A significant innovation of the WTO work program is the Trade Policy Review Mechanism ("TPRM"). Singapore strongly supported the surveillance of national trade policies undertaken in the TPRM and volunteered to be the first developing country to undergo a review. It was believed that such monitoring would increase the transparency of trade policies and practices, create improved public awareness of critical trade policy issues and provide a multilateral evaluation of the impact of domestic policies on the global trading system.

Because of the effectiveness of the WTO dispute settlement machinery, environmental and labor standards activists are attempting to bring these issues within the WTO ambit. The renewed focus in the WTO on issues such as competition policy, creating a level playing field for foreign direct investment, intellectual property rights and trade remedies will make future negotiations more difficult to conclude. Increasingly, the WTO is becoming involved in aspects perceived as falling within the domestic jurisdiction of states rather than cross-border issues. Earlier rounds of negotiation that focused on tariff reduction were easier to conclude than post-UR negotiations with their deeper and wider agenda.

VII. Singapore's Involvement in the WTO Dispute Resolution Process

Singapore has initiated just one dispute action, which was resolved at the consultations stage. Singapore's action against Malaysia arising from Malaysia's Approved Permit Scheme for the import of polypropylene and polyethylene is significant in the history of

WTO dispute settlement jurisprudence as it was the first action initiated under the newly strengthened Uruguay Round rules and it was the first action involving two developing country WTO members.[2]

The dispute resolution process is useful in clarifying and providing interpretative jurisprudence on the WTO Agreements. However, Singapore remains concerned that the increased use of litigation in trade disputes has resulted in the undermining of political support for the WTO, particularly from developing countries who face resource limitations in litigation. In the past, there was merit in the tendency for two parties involved in a dispute to negotiate issues and seek a mutually satisfactory settlement.

Senior representatives of Singapore have served on WTO dispute settlement panels. Ambassador Tommy Koh chaired the panel on the Australia/New Zealand complaint against US safeguards on lamb in 2000 and the panel on Canadian subsidies for milk products in 1998. Ambassador K. Kesavapany chaired the second Banana Panel in 1993 and Ambassador Chew Tai Soo on Korea's restrictions on beef, while Ms. Margaret Liang chaired the panel reviewing the EU's trade description of sardines. Tommy Koh was also a member of the panel which considered the EU's complaint against the United States on the Helms-Burton Act in 1997.

Their participation in these panels reflects Singapore's institutional support for WTO processes and the WTO membership's awareness of Singapore's contribution to the strengthening of the WTO. The nomination of Singapore officials to serve on key panels highlights the emergence of a group of Singapore foreign service and trade officials with an understanding of the WTO and of its emerging jurisprudence.

VIII. Principal Issues Singapore Would Like to see Taken Up in the Next Round

As a major exporter and free trader, Singapore supports comprehensive liberalization of trade in goods. Given the continued existence of tariff peaks and escalation, Singapore wants to see the removal of remaining market barriers in industrial goods (both tariffs and non-tariffs). As a major maritime nation and air communications hub, Singapore would be keen on the establishment of multilateral disciplines for maritime and air services. Singapore also desires strong clarified rules to prevent the protectionist and arbitrary use of trade remedial action (especially anti-dumping and safeguards actions). Rules to ensure simplification of customs procedures are also important to Singapore in promoting trade facilitation.

Singapore supports early action on the built-in agenda of the WTO. The two major sectors mandated by the built-in agenda for negotiations are agriculture and services. These are two major sectors of the global economy and further concessions in these areas would contribute to the process of trade liberalization. The built-in agenda also calls for reviews of TRIPs, TRIMs and Dispute Settlement. Singapore recognizes the concern of the developing countries that the implementation of the UR agreements should be reviewed in the Doha Round, especially those provisions that have disadvantaged developing countries because of the costs of implementation and the need to divert scarce manpower resources to uphold their commitments. However, the resolution of implementation issues should not be a pre-condition for progress in the ongoing negotiations.

Singapore also supports further work in the harmonization of cross-border laws and policies facilitating a conducive international environment. In particular, Singapore is

[2] *Malaysia—Prohibition of Imports of Polyethylene and Polypropylene*, WT/DS1, Request for Consultations Under Article XXIII: 1 of the GATT 1994 by Singapore, January 13, 1995.

keen on establishing a global environment that would allow electronic transactions to flow freely and encourage worldwide growth in electronic commerce.

IX. Strategies to Accomplish Singapore's Objectives in the Next Round

After the successful launch of the new round of negotiations in Doha in December 2001, Singapore wants to see the negotiations concluded successfully as expeditiously as possible. At this point, Singapore sees the need to balance its objectives with the setting of a realistic scope for a new round that is acceptable to all, in particular the developing countries that are concerned about the inclusion of social issues, investment, competition policy and the environment. Singapore therefore participates in groups with common interests, and forms coalitions with other parties that advocate moderation in competing ambitions and encourages the finding of realistic packages acceptable to all.

As a result of its exposure to GATT/WTO negotiating processes, Singapore supports more frequent consultations of capital-based staff at a senior level. From 1995 to 1999, Singapore participated actively in the informal meetings of the unfortunately named Invisibles Group of capital-based representatives comprising fifteen or sixteen key players in the WTO process. It also played a pro-active role in the group of small and medium sized countries supporting the launch of a new round of negotiations. The Friends of the New Round held several meetings that helped to establish a mutual sense of confidence and understanding amongst Ministers from these countries and facilitated their cooperation at the Ministerial Conferences. Singapore hosted an informal Ministerial Meeting in October 2001, just before the Doha Ministerial Conference. This meeting provided a clearer appreciation of the key issues that needed to be resolved at the Doha meeting and helped to galvanize support for compromises and policy shifts which paved the way for the successful launch of the New Round.

As Chairman of the Ministerial-level negotiating group on agriculture at the Seattle and Doha meetings, Singapore's Minister for Trade and Industry, George Yong-Boon Yeo played a key role in reaching compromises and developing forward-looking negotiating proposals. Although agriculture is likely to pose the greatest challenge in the next round of negotiations, George Yeo was the committee chairman who made the most progress in the abortive Seattle meeting. He was therefore approached to handle agriculture in Doha. As Singapore has no significant agricultural sector, the selection of the Singapore representative to chair the most contentious issue at the meeting reflects Singapore's leadership role in the WTO system.

X. Singapore's Involvement in Regional Trading Arrangements ("RTAs")

Unlike Europe and North America, Singapore and other East Asian states focused solely on multilateral trade negotiations through the 1970s and 1980s. Although ASEAN was established in 1967, substantive ASEAN economic cooperation only occurred with the establishment of the ASEAN Free Trade Area ("AFTA"). Singapore participates in AFTA together with its ASEAN counterparts: Brunei Darussalam, Cambodia Indonesia, Laos, Malaysia, Myanmar, Philippines, Thailand and Vietnam. There has been an accelerated increase in the level of total ASEAN trade as well as intra-ASEAN trade since the 1993 launch of the Common Effective Preferential Tariff Scheme for AFTA, the main instrument for realizing AFTA. (To illustrate, ASEAN exports grew by 19.8 percent from 1999 to 2000, and ASEAN imports grew by 22.4 percent in the same period.

Intra-ASEAN exports grew by 27.0 percent while intra-ASEAN imports grew by 26.7 percent in the year 2000, higher than the growth of total world exports and total imports.) At present, 88 percent of all tariff lines currently accounting for 98 percent of intra-ASEAN trade are already in the 0–5 percent category. Intra-ASEAN tariffs on about 20,000 tariff lines from the original six ASEAN members (Brunei Darussalam, Indonesia, Malaysia, the Philippines, Singapore and Thailand) were eliminated by 2002. This accounts for seventy percent of intra-ASEAN trade.

Apart from the accelerated tariff reductions affecting intra-ASEAN trade, the ASEAN Heads of Government at their Third Informal Summit in Manila in November 1999, committed to achieving total elimination of tariffs by 2010 for the six original members, ahead of the earlier 2015 deadline. For the newer ASEAN members (Cambodia, Laos, Myanmar and Vietnam), the end date for tariff elimination for intra-ASEAN trade was brought forward to 2015, ahead of the earlier 2018 deadline. These deadlines were subsequently revised in September 2004 to 2007 for the six original members and 2012 for newer ASEAN members. However, for selected sensitive products, the end date could remain at 2018.

Today, Singapore has moved from a purist adherence to multilateral approaches to trade liberalization towards a pragmatic recognition that there has been a growing trend towards RTAs and bilateral FTAs, especially during the 1990s. *First*, the expansion of the European Union and the establishment of the North American Free Trade Area concurrently with the ongoing Uruguay Round negotiations demonstrated that regional relationships did not detract from a commitment to the multilateral process. *Second*, the convening of the APEC Leaders' Meeting in Seattle in November 1993 and fears of an Asia-Pacific FTA excluding Europe resulted in the EU's decision to concede to the inclusion of agriculture within the GATT disciplines, enabling the conclusion of the UR. These developments led Singapore to conclude that RTAs could play a positive role, an observation reinforced by the agreement on sectoral liberalization within APEC serving as a model for sectoral liberalization in the WTO. *Third*, the recognition within the WTO that ASEAN represented a successful model of developing country RTA resulted in ASEAN being represented in the major informal caucuses within the WTO. *Fourth*, the East Asian financial and economic crisis of 1997–1998 and the stalemate at the WTO resulting in the failure of the WTO Ministerial Conference in Seattle in December 1999 to launch a new round of global negotiations led to a renewed interest by Singapore and other East Asian states in FTAs. These East Asian states felt that it was possible to reach regional agreements more quickly and over a wider range of issues than seemed possible in the WTO.

Singapore's current approach is to seek "WTO-plus" agreements in its FTA negotiations. While multilateral agreements are Singapore's preferred option, policy-makers regard bilateral and regional FTAs as complementary arrangements that reinforce a commitment to open markets, expanded international trade and the promotion of foreign direct investment.

Singapore believes that FTAs complement the multilateral trading system in several ways. *First*, bilateral and regional FTAs can serve as building blocs towards multilateralism as they are easier to conclude than multilateral agreements involving 144 members. FTAs are perceived as sustaining the momentum of global trade liberalization, allowing WTO members willing to move ahead of their WTO commitments to do so. This creates a strong incentive for the WTO to "catch up". *Second*, FTAs can be a test bed for new and innovative models of rules governing economic activity. Such innovations may subsequently be adapted for global use. FTAs can therefore provide positive complementary

pressures for the evolution of WTO agreements. *Third*, since FTAs are formed between a small number of partners and at a pace that is comfortable to all parties, they are an effective means of preparing societies for greater transborder exposure at the multilateral level. Such FTAs provide an important demonstrative effect of the benefits of trade liberalization.

In pursuit of this new policy, Singapore has concluded negotiations with New Zealand, Japan, EFTA, Australia, Jordan and the United States, and is currently negotiating with Canada, Mexico, Chile, South Korea, India, Sri Lanka, Bahrain, Panama and Egypt. Singapore's first trading arrangement with New Zealand signed on November 14, 2000, has yielded positive results. Two-way trade between Singapore and NZ increased more than twenty percent in the first six months after the arrangement came into effect. These bilateral negotiations exposed the negotiators to the issues involved in such negotiations, even though the direct trade impact is likely to be less significant than other ongoing negotiations. The signing of an Agreement between Japan and Singapore for a New-Age Economic Partnership by the two Prime Ministers on January 13, 2002, broke new ground in the region by promoting paperless trading, competition policy, supporting research and development in science and technology and included cooperation in information and communications technology, financial services and tourism. It also included standard GATT/WTO issues such as tariff reductions, mutual recognition of standards, and expanded opportunities for trade in services, government procurement and investment.

The most significant RTA negotiated by Singapore is the United States-Singapore FTA. It covers a comprehensive range of subjects including trade in goods and services, investment, e-commerce, customs, textiles and clothing, intellectual property rights, rules of origin, government procurement and financial services, and is designed to cover "substantially all trade", consistent with WTO obligations. The United States also proposed an integrated sourcing initiative that would benefit other countries in the region in certain designated sectors. Initially, this initiative will allow more than a hundred information technology products to be exported from Singapore to the United States duty-free without any further fees or paperwork even though much of the manufacturing will be performed in Indonesia.

Singapore's pursuit of free trade arrangements ("FTAs") initially led to regional suspicion, particularly from some of its ASEAN colleagues. Singapore has therefore made concerted efforts to impress upon its neighbors that such suspicions are unfounded, and that FTAs that are WTO-consistent and WTO-plus are actually linchpins linking the region with the rest of the world, creating overall competitive liberalization.

The changing attitude in ASEAN is seen in ASEAN's decision to support negotiations with China for a China-ASEAN FTA. Chinese representatives have proposed a 2010 deadline for the establishment of the FTA, matching the APEC 2010 deadline for free trade and investment for developed country members of APEC. Japan has also called for an East Asian community involving Japan, the ASEAN countries, China, South Korea, Australia and New Zealand as core members. However, Japan's unwillingness to consider significant agricultural liberalization is likely to hinder its efforts to create a broad-based economic partnership and to stake a claim for regional leadership. ASEAN has also been developing proposals for a Closer Economic Partnership with Australia and New Zealand and an FTA with India. At the 2001 ASEAN Summit, President Kim Dae Jung of South Korea agreed to set up a study group to review a possible ASEAN-ROK FTA. Despite the earlier criticisms by some ASEAN countries of Singapore's FTA initiatives, all ASEAN countries have agreed to proceed with these studies.

Singapore also supported trade and investment liberalization in the Asia Pacific Economic Cooperation ("APEC") forum. APEC is significant to Singapore as it accounts for 75 percent of Singapore's trade. Thus the achievement of the 1994 Bogor goals of free and open trade and investment for developed countries by 2010 and for developing countries by 2020 would be a significant milestone for Singapore.

XI. Development of Trade Policy in Singapore

Singapore's trade-to-GDP ratio is the highest in the world. Trade policy therefore attracts close attention at the highest levels of government. Key decisions are made at the Cabinet level. As all Ministers are elected Members of Parliament, political support for critical trade and investment initiatives is factored into decision-making. The Singapore Government attempts to shape domestic public opinion instead of merely responding to a changing policy environment. The political leadership has therefore viewed its task as one of educating domestic opinion on the challenges posed by a rapidly evolving global framework. As a small state, Singapore has always perceived itself as vulnerable and has emphasized flexibility, innovation and change. While Singapore focused on multilateral trade negotiations in the past, it now adopts a flexible and pragmatic policy of seeking bilateral, regional, cross-regional and multilateral negotiations with the objective of ensuring faster trade and investment liberalization. Each of these approaches is seen as a policy tool enabling more effective governance and a more open and competitive international environment.

Trade policy formulation in Singapore is undertaken by the government ministries, with advice and many aspects of policy execution channeled through statutory boards linked to main ministries. These boards include International Enterprise Singapore ("IES"), formerly known as the Singapore Trade Development Board ("TDB"), and the Economic Development Board ("EDB"), which are linked to the Ministry of Trade and Industry ("MTI").

The MTI is mainly in charge of the formulation of trade policy; the IES is responsible for the internationalization of Singapore enterprises, while the EDB implements policies on investment incentives. (When IES replaced TDB in 2002, the function of formulating and implementing trade policy was centralized in MTI). The Department of Customs and Excise, under the Ministry of Finance, administers the collection of duties on international trade and excise duties. Service-related policies are divided among a number of Ministries and statutory boards, although the MTI plays a coordinating role in the development of trade policy in the services sector.

A well-established structure exists for regular consultation on economic and trade policies between the Government and the private sector. In 1995, the EDB established its International Advisory Council, composed of a panel of leading international businessmen, to advise the Government on economic strategy. The newly formed Singapore Business Federation, with a membership comprising of the major domestic and multinational enterprises operating in Singapore, is playing an increasingly active role in commenting on trade policy and interacting with its international counterparts. It recently established an International Trade Committee to provide inputs on issues that are the subject of multilateral, regional and bilateral trade negotiations. The public is also free to comment on trade policy through the media, or directly to the Government.

Since 1973, when Singapore acceded to GATT, there has been an emphasis on domestic capacity building on trade policy issues. Initially, foreign service officers selected on an *ad hoc* basis represented Singapore at GATT meetings. Senior foreign service officers

continue to serve as Permanent Representatives to the United Nations in Geneva and are concurrently accredited to the WTO. Singapore's representation at the WTO also includes staff representing MTI/IES. TDB (now IES) began developing a core group of trade policy analysts and negotiators from 1985 who moved to MTI in 2002. The hosting of the first WTO Ministerial Conference in December 1996 provided the impetus for the strengthening of MTI and TDB's capabilities. In recent years, there has been a noteworthy emergence of a group of lawyers in Singapore specializing in WTO jurisprudence.

Currently, trade negotiations involve close coordination between MTI, the Ministry of Foreign Affairs ("MFA") and other government ministries and agencies. As the WTO has moved beyond tariff issues, issues on the WTO agenda increasingly involve a range of government ministries. There will be an increasing need to consult with domestic industries affected by proposed changes in the WTO regime as well as the opening of markets through bilateral and regional FTAs. Maintaining political support for trade liberalization will be a major task for MTI and MFA as they project Singapore's support for more ambitious objectives in future trade negotiations.

XII. Conclusion

As a small state with an open economy, Singapore has a strong interest in the maintenance of strong multilateral economic institutions and continued liberalization of international trade and investment. Singapore has therefore seen itself as a supporter of the strengthening of the WTO system and has actively supported further rounds of trade negotiations. The recognition that bilateral and regional trading arrangements offer scope for faster trade liberalization has led Singapore in recent years to support such FTAs, in addition to the promotion of global trade negotiations. While Singapore was a passive participant in GATT when it first acceded to the GATT Agreements, it played an increasingly active role and has built-up strong analytical and negotiating capabilities in the last two decades. These capabilities enabled Singapore to play an influential role in various informal caucuses within the WTO as well as a leadership role within the group of countries seeking faster trade and investment liberalization.

* Professor in the Faculty of Law, University of Stellenbosch and Senior Advisor to the Trade Law Centre for Southern Africa ("TRALAC"). I want to thank Libo van Aswegen, Researcher, TRALAC, who assisted invaluably with the research and interviews. This contribution was made possible by a grant from SECO (the Swiss State Secretariat for Economic Affairs). The opinions expressed here are those of the author.

I. Introduction

A. General Background

South Africa underwent dramatic and fundamental political change in the early 1990s. These developments coincided with the final stages of the Uruguay Round multilateral negotiations establishing the World Trade Organization ("WTO"). This is an important factor in explaining this country's involvement in those negotiations and its present position in the international trading system. There was a direct link between South Africa's international political isolation under the apartheid regime and its former economic and trade policies. Freed from the shackles of apartheid, the state began to address a wide range of political, institutional and structural problems; both domestically and internationally. For the first time it was able to play the regional and international role commensurate to its potential.

What exactly were the changes that occurred in South Africa and why did they happen at that particular moment? What were the major results and direction of the changes? The answers to these questions will shed some light on the rather unique developments of that time and reveal how they impacted on the country's subsequent position in the international trade system. A brief historical overview will provide a necessary perspective on South Africa's internal reconstruction and new international role.

South Africa was a Contracting Party to the General Agreement on Tariffs and Trade of 1947 ("GATT").[1] The conditions under which the Union of South Africa[2] participated in the Bretton Woods negotiations after World War II were quite different compared to those of the 1980s and 1990s. When the GATT was negotiated South Africa was a respected member of the post World War II international community and with its then Prime Minister, Field Marshal Jan Smuts, having been a member of the Allied War Cabinet, it played a prominent role in the formulation and adoption of the United Nations' Charter.

It should also be recalled that practically the whole of the African continent was then still under colonial rule, whereas South Africa had been a fully fledged member of the League of Nations, the mandatory power over South-West Africa (pre-independence Namibia) and a founding member of the political and economic institutions of the post World War II order. It was considered a "western" state and an ally against communism in the subsequent Cold War.

At the time of the Uruguay Round negotiations all this had changed dramatically. Racial discrimination, that serious flaw in the South African political system, had spiraled out of control in such proportions over the following decades that South Africa had became a pariah state. The political order deliberately excluded the black majority from participation. The consequence was domestic destabilization, an inability to function as a normal member of the international community and becoming the prime target for sanctions. Apartheid South Africa did not subscribe to the values of the United Nations Charter. It invoked artificial and ingenuous interpretations of Article 2(7) of the UN

[1] The GATT was approved by an act of the South African Parliament in 1948. It was, however, never incorporated into domestic law and its provisions could therefore not be invoked before South Africa's national courts. *The Republic of South Africa—Report by the GATT Secretariat*, 1 TRADE POLICY REVIEW 2, 39 (1993).

[2] In 1910 the former British colonies and Afrikaner republics were incorporated into a state entity known as the Union of South Africa. The Union was a member of the British Commonwealth. In 1961, when H.F. Verwoerd was the Prime Minister, South Africa became a Republic and left the Commonwealth. This occurred as a result of the mounting pressure against apartheid. South Africa returned as a member of the Commonwealth after the political changes of 1994.

Charter on domestic jurisdiction and self-determination in desperate legalistic efforts to defend its policies. For some time it enjoyed support from certain Western governments as an ally in the Cold War, but even this "support" evaporated as domestic and international opposition strengthened against apartheid.

In 1948 the National Party came to power and apartheid became the "official" policy; resulting in even more discrimination and white privilege. Racial discrimination in South African politics and daily practice did not, however, begin in 1948. It was already part of the colonial history. One of the most controversial earlier laws was the Land Act of 1913. It had devastating consequences for black South Africans and subsequent labor and social practices.[3] One of the major consequences of apartheid was an economy with serious structural imbalances and inherent unfairness. As the rest of the world adopted the Universal Declaration of Human Rights in 1948, the South African government headed in the opposite direction and legally entrenched racial discrimination as its official policy.

South Africa suffered increased isolation and found itself the target of both UN and bilateral sanctions.[4] These sanctions, disinvestment and other punitive measures affected its international political standing, its ability to trade and borrow and its participation in international organizations. Its economic and trade policies reflected this dilemma as the government reacted to its isolation and the sanctions against it. The South African government responded with several counter-strategies; ranging from emphasizing its strategic importance in the Cold War and the importance of its mineral wealth, to expanding its military might (it developed a nuclear capability) and destabilizing its region.

Domestic policies and structures of government became shaped by the implementation of apartheid policies. There was a time when the South African government actively pursued its own version of "self-determination" as the blue print for preserving white rule. This resulted in the establishment of "homelands" for the various black ethnic groups. These territorial units received far-reaching governmental powers (four of them were even granted "independence"), their own budgets and state-like powers; resulting in costly duplication and structural distortions in the economy.

South Africa eventually resolved its domestic political problems through a negotiated settlement, leading to democratic rule and the election of Nelson Mandela as the first President of the new South Africa in April 1994.[5] Several complicated problems now had to be addressed. A priority was to free the economy from the effects and structural distortions of apartheid and its disempowerment of the black majority. In

[3] "The land Act imposed a policy of territorial segregation with a very heavy hand. It aimed specifically to get rid of those features of African land ownership and share-cropping which white farmers found undesirable and at the same time to increase the size of the African reserves for the more convenient recruiting of labour for the mines." DAVENPORT, SOUTH AFRICA—A MODERN HISTORY 259 (1987).

[4] South Africa became the first UN member to face Chapter VII Security Council measures when in 1977, after the death of Steve Biko, Security Council Resolution 418 was adopted and an arms embargo imposed. The drive in the General Assembly for sanctions against South Africa started much earlier. Its racial policies featured on the UN Agenda since 1946 when India complained about the treatment of Indians in South Africa. Since the 1950's several General Assembly resolutions were adopted calling upon South Africa to reconsider its racial policies. In 1962 the GA adopted Resolution 1761 (XVII), requesting members to boycott South Africa and impose sanctions. The list of targets grew over the years to include cultural, sports and educational boycotts, in addition to trade, investment and military co-operation.

[5] For a discussion of the nature of South Africa's negotiated settlement *see*, *inter alia*, EBRAHIM, THE SOUL OF A NATION: CONSTITUTION-MAKING IN SOUTH AFRICA (1998), THE SMALL MIRACLE: SOUTH AFRICA'S NEGOTIATED SETTLEMENT (Steven Friedman and Doreen Atkinson eds. 1994) and VAN WYK, RIGHTS AND CONSTITUTIONALISM—THE NEW SOUTH AFRICAN LEGAL ORDER (1994).

addition, the new government had to guide the country towards a constructive international role with special responsibilities in the Southern African region and on the African continent.

To summarize the nature of the change in South Africa: it formally "normalized" the state and society by the establishment of a democratic system and the adoption of a modern and liberal constitution.[6] However, this has created many new challenges, including the need to address the legacy of the past. South Africa is still a society undergoing fundamental transformation.

Why did apartheid end and what forced the change in the early nineties? The brief and simple answer is that the costs of apartheid became unbearable. This can in part be attributed to the sanctions, but the liberation struggle contributed immensely. Other factors include Namibia's peaceful transition to independence in 1990,[7] the end of the Cold War,[8] and changes in the composition and opinions of the then South African political leadership. The latter was of particular importance for the peaceful nature of the transition itself. Under different personalities the struggle and warfare would probably have continued with even greater devastation and polarization. The invaluable personal contributions of Nelson Mandela and F.W. de Klerk were recognized by the international community in the joint-awarding of the Nobel Peace Prize.

B. Political, Constitutional and Institutional Transition

If the extraordinary transition of the early nineties had not taken place, South Africa would not only have remained a country with major internal problems, but would presumably still have been an isolated bystander to the formal international trade structures (and perhaps not even a member of the WTO). The inclusive and peaceful nature of the process leading to majority rule was a catalyst for fundamental change even before the elections of April 27, 1994. The delegation representing South Africa in the final stages of the Uruguay Round negotiations was expanded to include members of the African National Congress (and its alliance partners), the labor movement and the business sector. This had a far-reaching effect on the legitimacy of the South African representation, the negotiating strategies and the content of new trade policies. This far-sighted decision contributed directly to government continuity and a smooth transition in this particular field. It made it unnecessary for the new government of President Mandela to renegotiate international obligations or to redevelop its trade policy positions as his government was informally party to the negotiations during the final stages of the Uruguay Round.

[6] The Constitution of the Republic of South Africa Act, 108 of 1996 is supreme law, contains a comprehensive bill of rights and is fully justiciable. A newly established Constitutional Court rules on its final application and interpretation.

[7] Namibia became independent in 1990 with the implementation of UN Security Council Resolution 435 of 1978 after a protracted political struggle and a liberation war that started in 1967. For a discussion of the Namibian independence process, *see* THE NAMIBIAN PEACE PROCESS: IMPLICATIONS AND LESSONS FOR THE FUTURE (Heribert Weiland and Matthew Braham eds. 1992) and NAMIBIA: CONSTITUTIONAL AND INTERNATIONAL LAW ISSUES UNISA (Dawid van Wyk, Marinus Wiechers and Romaine Hill eds. 1991). The stability of the Namibian transition allayed the fears of many white South Africans about communist takeovers, land expropriation and anti-white retaliation. Reasons and justifications frequently proffered in opposition to Namibian independence now lost their "validity". This added impetus to a process of questioning other official South African policies.

[8] The fear of communism and the feared "total onslaught" (allegedly to be launched via the liberation movements) had always been important ideological arguments of the apartheid government and motivated expensive wars fought in neighboring countries such as Namibia and Angola.

A brief description of the nature of the transition in the early nineties to a democratic system is necessary to understand the current political, economic and legal framework of the new South Africa. The political changes of that time met with enthusiastic international approval and all sanctions were soon lifted. This allowed South Africa to take its rightful place in the international community as a respected and active member and had important consequences for its future role in the WTO as well as in the Southern African region.

The political and constitutional transition was a two stage process. The negotiated settlement involved all South African stakeholders and political parties. Parties that were previously banned could now participate and all political prisoners were released, including Nelson Mandela who had spent 27 years behind bars. A notable feature of the negotiations was that it was conducted by South Africans themselves and not under the control of any international organization. The transition did not lead to the establishment of a new state, only the creation of a democratic and legitimate government. All previous international agreements, including membership of international organizations, therefore remain in effect.

The negotiations resulted in the drafting of an Interim Constitution which came into force on April 27, 1994, the date of the first democratic elections which brought the ANC into power. The Interim Constitution was a comprehensive and modern document incorporating a novel feature: a set of 34 Constitutional Principles. These Principles provided a normative framework for the drafting of a final constitution. This final constitution had to be negotiated by the newly elected parliament which also represented the will of the people as it functioned as a constitutional assembly. In this sense there was a popular mandate. This body had to draft a supreme constitution within the limits set by the 34 Constitutional Principles; in other words all these Principles had to be entrenched in the constitution and nothing in the final document could infringe any of the Principles. Compliance with these Principles was guaranteed by the newly established Constitutional Court which had to certify the text of the final Constitution. This process was accompanied by extended hearings before the Constitutional Court. There was never a formal referendum but this allowed the voice of all South Africans to be heard through public participation in the hearings. The initial text of the new Constitution was indeed not certified by the Constitutional Court but after some amendments it was found to be in conformity with the Constitutional Principles. This certified text became the final Constitution of the Republic of South Africa in 1996.[9]

The new Constitution provides a fundamental shift from the previous doctrinal position and the rules with respect to the foundations of state authority and control of the exercise of power. Whereas the new Constitution provides for the separation of powers and judicial review, under the previous arrangement, South African constitutional law was based on the English common law notion of the sovereignty of Parliament. This also meant the absence of judicial review by invoking the Constitution, as well as a lack of effective protection of human rights. Parliament was sovereign and the courts could not declare an act of Parliament unconstitutional and invalid.[10] Parliamentary sovereignty also influenced the domestic application of international law as acts of parliament could not be tested. International treaties had to be incorporated through legislation in order

[9] The Constitution of the Republic of South Africa Act, 108 of 1996.

[10] The sole exception to this was a limited power of review with respect to certain "manner and form" requirements. *See* in this regard Heinz Klug, *Recent South African Constitutional History* in CONSTITUTIONAL LAW OF SOUTH AFRICA (Matthew Chaskalson *et al*. eds. 1996).

to apply domestically, thereby following a strict dualist approach. The negotiation and ratification of international agreements was the sole prerogative of the executive branch of government. Prerogative powers were considered to be not justiciable. International law could, therefore, not play any meaningful role in the jurisprudence of South African courts.[11]

C. Conclusion: A Changed Society

The many political, economic and structural changes in South Africa during the early nineties set in motion a process that is still continuing. The present government is still developing and implementing policies on black empowerment, deregulation, the adoption of "charters" for specific sectors, opening up the economy, promoting investment, eradicating poverty and pursuing trade liberalization. New trade agreements have been concluded with the EU and Southern African neighbors, while several others are planned.[12]

This process poses many challenges, but also provides opportunities to reconstruct the fragmented society, as well as to normalize relations within the region, the African continent and the rest of the world. This exciting task coincides with major new developments in the multilateral trading system and there is some degree of mutual reinforcement here. The general picture is one of amazing political transformation, bringing peace to a divided society, coupled with far-reaching economic reform. Active participation in the activities of the multilateral WTO is very much part of the policies and actions of the new South Africa.

II. South Africa's Participation in the Uruguay Round

A. Towards a New Policy

Despite a rather slow start as a result of the lingering isolation of the apartheid regime, South Africa developed into quite an active participant towards the end of the Uruguay Round. The informal participation of the ANC in the South African delegation contributing to this new state of affairs.

Officials of the South African Department of Trade and Industry found it difficult to stay abreast of discussions during the early stages of the Uruguay Round as other African governments actively opposed their participation.[13] Although South Africa was not officially kicked out of the GATT it could not actively participate. This pattern was repeated in other international organizations where the credentials of the South African delegation were often refused, thereby preventing delegates from participating despite South Africa remaining a member of the organization.

South Africa's renewed activity in the Uruguay Round can also be ascribed to the positive effect that the GATT Trade Policy Review of South Africa (1993) had on the trade policy liberalization then underway in South Africa. In 1990, prior to the Trade

[11] JOHN DUGARD, INTERNATIONAL LAW: A SOUTH AFRICAN PERSPECTIVE (2000), Ch 4.

[12] At the time of writing, the Southern African Customs Union ("SACU"), with its members states of Botswana, Lesotho, Namibia, South Africa and Swaziland, was negotiating (or intended to negotiate) free trade agreements with the United States, India, EFTA, China and Mercosur.

[13] For example, certain Anglophone African countries took the initiative to have South Africa excluded from the Ministerial Conference in Punta del Este that launched the Uruguay Round. These efforts were unsuccessful as they did not enjoy the support of some Francophone African countries, and efforts to persuade the Uruguay government to withdraw the visas of the South African delegation failed.

Policy Review, the government had instructed the Industrial Development Corporation ("IDC") to review South Africa's tariff protection policy with a view to moving towards a more liberal system.[14] The Board on Tariffs and Trade ("BTT") acted as advisory body. The combined efforts of the IDC and BTT culminated in South Africa's provisional Uruguay Round tariff offer of 1990. This offer was, however, not received with much enthusiasm. The main areas of concern with South African trade policy were the tariff structure, the high level of customs tariffs, export subsidies, import controls, local content requirements, import surcharges and the fact that South Africa had not acceded to most of the GATT Codes. The offer proposed to bind only approximately 55 percent of South African industrial tariffs. The mean average tariff rate reduction amounted to no more than 23 percent which was well below the GATT goal of 33 percent.

During the GATT Trade Policy Review of South Africa the GATT members urged South Africa to improve its provisional Uruguay Round tariff offer. In response, the South African representatives indicated that South Africa intended to submit a revised tariff offer, in the framework of the Uruguay Round, which would improve the level of bindings, reduce the average rate, improve the duty rebate and drawback system for exporters and the adjustment of the General Export Incentive Scheme ("GEIS") to reduce the anti-import bias. The revised offer was submitted on schedule, after discussion in South Africa's National Economic Forum ("NEF").[15]

The South African delegation met with representatives of South Africa's most important trading partners, as well as with various senior officials of the GATT Secretariat, before its Trade Policy Review hearings. The purpose of these meetings was, first, to obtain an indication of the questions that could be expected during the Policy Review, and, second, to discuss with these representatives and GATT officials the current economic situation in South Africa against the backdrop of the political negotiations and the functioning of the NEF. The meetings provided the relevant trading partners with a better understanding of the South African situation in GATT.

The National Economic Forum was launched on October 29, 1992 to provide a domestic dialogue mechanism for business organizations, labor organizations and government to address economic and socio-economic challenges, particularly during the period of political transition.[16] The NEF was the product of formal dialogue between labor and business begun in the early eighties. Those discussions culminated in an understanding that was subsequently endorsed by the South African cabinet in the *Laboria Minute* of September 14, 1990. This dealt with a range of labor and market issues, and clause 18 of the *Laboria Minute* made provision for an appropriate forum to discuss the economy and labor relations.

Two years passed before the NEF was formally launched. Government and business were concerned about the formal involvement of unions in policy discussions. It was feared that the Congress of South Africa's Trade Unions ("COSATU"), an alliance partner of the ANC, would advocate socialism as an alternative path of development in post-apartheid South Africa.[17] After continued pressure from organized labor, it was agreed to set up the NEF. It was not long before government joined what the former Minister of Finance, Derek Keys, later called the "golden triangle". The Long Term Working

Group ("LTWG") of the NEF was tasked with ensuring the successful reintegration of the South African economy into the world economy. The taskforce would address all aspects of trade policy, including tariff policy, phasing and sequencing programs and export incentives.[18] South Africa's undertaking to submit a revised Uruguay Round offer had the LTWG together with the DTI, the BTT and the IDC working to submit a revised tariff offer before the end of August 1993.

B. South Africa's Principal Objective

Coinciding with the end of apartheid, the closing stages of the Uruguay Round provided South Africa with an opportunity to reintegrate with the international system of political and economic cooperation, and so accelerate the liberalization and simplification of its trade regime.[19] South Africa pushed for improved market access for processed mineral products, light manufactures and agriculture.[20] South Africa viewed the Uruguay Round as an avenue for cementing the emerging change in policy direction, particularly with respect to the rationalization and simplification of its customs tariffs and the lowering and binding of customs duties. The government began to move away from a trade and industrial policy that promoted import substitution under the umbrella of extensive protective measures.[21] In the process South Africa was obliged to re-negotiate a number of bound tariffs that carried low or zero rates of import duty. The effect over time of these reforms was not insignificant. In the Trade Policy Review of South Africa of 1998 the following was reported:

> South Africa's simple average MFN import tariff at end-June 1997 was some 15%, with substantial dispersion; because of formula and specific rates the maximum ad valorem rate cannot easily be defined. Duty-free treatment applies to some 44% of all the tariffs, particularly on inputs of capital goods and products that are not manufactured in, and do not have substitutes in, South Africa. About 23% of all lines carry rates above 30%. Sectorally, the highest average tariff was in manufacturing where it was 15.6%, compared with 5.6% in agriculture and 1.4% in mining and quarrying. There is negative escalation in the tariff overall, but this may be misleading in that it mostly reflects the application of zero, or low duties on industrial products that are neither manufactured nor have substitutes in South Africa. The Tariff Rationalization Process should substantially simplify South Africa's tariff structure but it could increase escalation and therefore the effective rate of protection.[22]

In relation to its revised offer on industrial products, South Africa had some success in obtaining improved market access for processed mineral products, light manufactures and agriculture and in re-negotiating its entire schedule of tariff concessions. South Africa, Uruguay, Egypt and Peru were allowed to raise existing zero bindings on certain tariffs. These four countries were deemed to have re-negotiated their obligations in terms of GATT Article XXVIII. South Africa undertook to reduce its tariff level by one third on average over five years commencing in January 1995. Its offer to bind tariffs was also comprehensive, covering 98 percent of all industrial products. In addition, South Africa undertook to implement a process that would result in the tarrification of all remaining import controls. In relation to certain chemicals, clothing and textiles, footwear, motor

vehicles and components, and certain electronic equipment South Africa proposed eight-year phase-in periods. South Africa's accepted transitional needs made it possible to successfully negotiate these longer adjustment periods.[23]

South Africa's agriculture offer called for the tariffication of all import quotas[24] and the bindings of such tariff equivalents. The South African authorities were, however, aware of possible disruptions that the agricultural sector could suffer under this new dispensation. Accordingly, the ceiling rates were calculated to afford the same level of protection as before. Domestic reform of the agricultural sector followed.[25]

South Africa's services offer was among the most comprehensive of the developing countries.[26] As South Africa was not a *demandeur* in these negotiations, its offer proposed the binding or consolidation of the status quo in its service sector at that time.[27] There were minimal practice and policy implications then. South Africa also negotiated two Most-Favored-Nation ("MFN") exceptions, namely for the Common Monetary Area ("CMA"),[28] and had transport preferences extended to certain Customs Union partners.

South Africa's trade liberalization program aimed at reducing the overall level of protection on manufactured and agricultural products, simplifying and rationalizing the tariff structure through the Tariff Rationalization Process ("TRP") and restructuring incentive schemes for local companies. In line with the program, tariffs have been abolished on a number of imported goods not produced, and without substitutes, in South Africa. Import surcharges were eliminated in October 1995, and the General Export Incentive Scheme ("GEIS"), an export subsidy program, was terminated on July 11, 1997.[29]

C. The Basic Outcomes

The former South Africa was an isolated and awkward bystander to many of the main tendencies and international developments of the late 20th century. It was, for example, never part of the formal structures established by the decolonized states of Africa, such as the Organization of African Union ("OAU") and the Southern African Development Coordination Conference ("SADCC"). Both these organizations have in the meantime undergone their own restructuring; to become respectively the African Union ("AU") and Southern African Development Community ("SADC"). South Africa is now a member of both. South Africa also did not fit into the system of classification used for dividing members of international economic organizations into developed, developing and least-developed countries.

[23] For automobiles, South Africa negotiated a reduction of tariffs over a period of eight years with a four-year standstill prior to the start of the reduction. For textile and clothing, it negotiated for a reduction of tariffs over a period of twelve years with a four-year standstill prior to the start of the reduction. Leora Blumberg, *South Africa and the Uruguay Round*, 12 (5) DEVELOPMENT SOUTHERN AFRICA 670 (1995).

[24] Except on black tea (Chapter III(2)(iii)(b)).

[25] The Marketing of Agricultural Products Act was introduced in 1997 to promote the deregulation of the marketing systems. From 1992 to 1997 the number of agricultural control boards had been reduced from 22 to 14. These reforms are continuing.

[26] South Africa sees itself politically and to some extent also economically in the developing countries category. See further the discussion on its status below at the concluding part of this section.

[27] NATIONAL ECONOMIC FORUM, SOUTH AFRICA'S GATT OFFER IN TERMS OF THE URUGUAY ROUND 2 (1993).

[28] In July 1986 the CMA replaced the Rand Monetary Area ("RMA"). Since the Multilateral Monetary Agreement ("MMA") of February 1992, the CMA includes the countries of Lesotho, Namibia, South Africa and Swaziland.

[29] *Trade Policy Review, supra* note 22.

South Africa is an active member of the WTO, has been restored as an acitve member of other multilateral organizations, and now plays a leading role on the African continent. It is considered an "upper-middle-income developing country".[30]

On the domestic front it has embarked on a course of far-reaching economic reform and restructuring,[31] including reforms to allow its products to compete internationally.

In the 1998 Trade Policy Review Report of South Africa by the Secretariat the following general evaluation of the trade reforms is provided. It is a fitting description of the developments since the establishment of the WTO:

> The reintegration of South Africa into the world economy has contributed to an increase in its foreign trade. Merchandise imports have grown faster than exports, leading to a contraction of South Africa's traditional trade surpluses and to external current account deficits since 1994. The rise of merchandise imports also reflects the increase in investment; capital and intermediate goods, particularly machinery and mechanical appliances, represent some 30% of South Africa's total merchandise imports. South Africa is also a net importer of a broad category of services. International reserves (including gold) represented 1.3 months of imports in 1996, compared to 1.9 in 1992.[32]

III. The General Effects of WTO Membership

A. Trade Policy and Economic Reform

The Government's trade and industrial policies since the nineties were a necessary response to the process of integration into the global economy and the need for internal reform. Tariff reform in particular was a response to South Africa's perceived needs. The fact that tariff reform was required by South Africa's international obligations under the GATT and Uruguay Round negotiations gave added impetus to the process.

The South African economy, and consumers generally, experienced positive effects from the tariff reform process, which resulted in an increased awareness of the requirements regarding competition in the global market.[33] This was most clearly shown in trade within Africa. South African retailers, construction firms, mining houses and service providers[34] made major inroads into African markets. The most important markets for South African products remain, however, the EU, the United States, and potentially East Asia. The positive effect of the tariff reform process is also reflected in government policy through the simultaneous recognition of the political importance of the Southern African region and Africa generally, and the link between trade and domestic growth and development. The tariff reform process has not, as some feared, resulted in the "de-industrialization" of the South African economy. Penetration of the local market has occurred, but the net impact from expanding trade has been positive. Certain industries such as textiles and clothing have experienced negative effects but economists emphasize other adjustment pressures such as labor costs and lack of competitiveness.

[30] With a GNP per capita of US $ 3,160 in 1995, according to the World Bank (1997). This figure is, however, misleading as the decades of apartheid rule led to a concentration of economic power and a very distorted and unequal distribution of income. *See Trade Policy Review, supra* note 22, at 2.

[31] In 1994 the government adopted the Reconstruction and Development Programme ("RDP"), followed in 1996 by the Growth, Employment and Redistribution ("GEAR") strategy. These aim at the socio-economic development of the majority of the population, tighten monetary policy, fiscal consolidation and trade reform.

[32] *See Trade Policy Review, supra* note 22, at ix.

[33] Ministry of Trade and Industry, Consideration of Report of Portfolio Committee on Trade and Industry on Tariff Policy in the Context of Industrial Policy, at 170 (February 13, 1997).

[34] Television networks and mobile phone service providers are particularly active.

The joint effects of internal political change and re-integration into the global economy (which goes beyond WTO disciplines) resulted in a number of reform measures and changes. Their content and direction were determined by policy choices designed to reform, modernize and advance South Africa and to make it part of the "real world". They also aim at making South Africa a more fair, just and stable society. The global political and economic changes brought about by the end to the Cold War resulted in their own impetus and constraints; as did the dictates of the new Constitution.

For the majority of South Africans basic needs, poverty alleviation and employment are still priorities. The degree of their buying-in into the liberal-democratic values of the Constitution depends quite directly on how these developmental issues are addressed. Reforms in the area of trade have to take place against a background which will take these aspects into account.

A number of practical changes and innovations have occurred in the South African economy since 1994. Some of them, related to trade, can be mentioned. A new Competition Act (98 of 1998), the Intellectual Property Laws Amendment Act and an International Trade Administration Act (Act 71 of 2002) were, for example, adopted and aim at implementing WTO-related obligations. A number of public enterprises (including iron and steel and telecommunications) have been privatized or commercialized. South Africa has also restructured several state-owned service suppliers, although monopolies or exclusive rights remain in some areas, including port, airport, transport and fixed network telecommunication.[35] Reforms in these areas continue and competition in telecommunication is, for example, actively pursued, but has proven to be a complicated matter. Excepting limitations on the presence of foreign natural persons, services are generally open to foreign investment.[36]

Under its Uruguay Round obligations South Africa bound some 98% of its tariffs at the HS eight-digit level (excluding petroleum products), but its tariffs remain "complex",[37] with a wide variety of duties. Anti-dumping duties are frequently imposed and "trade remedies" are an important policy measure.

The general restructuring and steps toward "normalization" of the South African economy are a natural consequence of the emergence from isolation and sanctions and the establishment of a stable and democratic government based on democratic values and institutions that inspire political and investor confidence. This is accompanied by an expectation that South Africa will play a stabilizing role on the African continent. The changes in South Africa are not only significant because of subsequent development in the country itself, the impact has a broader, regional dimension.

Development coincided with important changes in international affairs after the demise of the Cold War, with a greater emphasis being placed on the link between democratic rule, respect for the rule of law and economic development. The constitutional and political reforms have provided a positive framework for economic reform. Many challenges remain; such as the urgent need to eradicate poverty, to redress imbalances in wealth distribution, and to ensure regional growth and stability. Answers to these problems require well-developed trade policies and active participation in the global economy. Important trade agreements have been concluded[38] and others are being negotiated.[39]

[35] *See Trade Policy Review, supra* note 22, at xiii.

[36] *Id*.

[37] *Id*. at xi.

[38] Such as the Trade, Development and Co-operation Agreement with the EU, South Africa's largest trade partner.

[39] Negotiations on a free trade agreement between SACU and the United States began in May 2003.

If participation in the WTO is viewed as the symbol of South Africa's re-integration into the global economy, it also fortunately coincides with its domestic reforms. This process has generated much change, but the general trend seems to be positive. It must, however, be pointed out that South Africa, as a developing country with peculiar domestic problems related to structural imbalances and urgent poverty alleviation needs, does not escape the constraints of such factors.

South Africa also shares the view that the Uruguay Round has introduced many "disadvantages" for developing countries. "It caused them to open up their markets to industrial goods without them gaining sufficient access for their own products. There was a need to ensure that the same did not happen on agriculture in the Doha Round."[40]

It seems fair to conclude by linking the Uruguay Round results to the promises of the "Development Round" of Doha. The former set in motion a process of major structural reform in the global trade regime. For developing countries that process must be continued and new structural adaptations, addressing their needs, are required. The Uruguay Round was not a final and conclusive stage in global reform.

B. Political and Social Effects

The political agenda in South Africa is not dominated by the WTO as such and the Uruguay Round was overshadowed by the transition to majority rule. Globalization issues such as economic reform and regional relationships have subsequently developed as areas of concern. These are issues that feature on the WTO and Doha agendas and in that sense the WTO is politically relevant to the major economy of Southern Africa which is affected by changes in international trade patterns and law; just as it was affected by the structural changes and logical consequences of the abolition of apartheid rule.

South Africa wants to be an active member of the international community and international organizations. It played host to the World Summit on Sustainable Development in 2002. This provided an opportunity also to focus on local issues such as the impact of poverty on rural environments, urbanization, supply of fresh drinking water and food security within a global context.

AIDS is an area of great concern for South and Southern Africa. The highest infection rates in the world are found in this part of the world. The availability of medicines for the treatment of HIV infected persons, especially pregnant women, has been the subject of controversy. This included a high-profile court case in 2001 when 28 major international pharmaceutical companies challenged proposed legislation to regulate the availability of medicines,[41] but subsequently withdrew because of the negative public image generated by local and international media coverage of the case. The opposition by the international pharmaceutical companies to major reforms in the international legal arrangements which would allow access to vital medicines for poor nations, has not ceased. The reform of the TRIPS Agreement is still a controversial issue on the Doha agenda.

The furor about AIDS continues as the South African government refuses to accept the scientific community's explanations as to the causes of this disease. This negative

[40] Trade and Industry Minister, Alec Erwin, reported in the Business Day (June 18, 2003), at 2.

[41] The main issue in this case focused on an amendment to the Medicines and Related Substances Control Act, 101 of 1965, which provided for parallel imports and related issues. The Minister of Public Health also received powers to authorize the importation of certain medicines on terms not complying with registration requirements applicable to other medicines.

publicity has led to further court cases, this time to force the government to provide free medication to certain categories of patients.

Other important political developments have occurred in regional and pan-African relationships. South Africa has taken up a prominent role on the African continent through "The New Partnership for Africa's Development" ("NEPAD") initiative and the expectation that it will promote similar development, stability and democratic rule in the region.

NEPAD is an ambitious initiative by African leaders[42] to devise a strategy for addressing Africa's acute developmental needs in a manner that will demonstrate a serious commitment by African governments and be sufficiently realistic to attract international support. The link between peace, security, democracy and governance on the one hand, and the various facets of economic development and the need for poverty alleviation and investment on the other, is emphasized. Improving the quality of governance is a priority and in this regard the NEPAD peer review process attracted considerable interest. This involves certain African governments agreeing to performance standards and criteria subject to a process of monitoring and assessment.[43]

Closer to home, the crisis in Zimbabwe has caused considerable local and international concern, especially since African governments have as of yet failed to find a solution for this political and economic disaster.

These are not issues directly related to the WTO, but they demonstrate the inter-related nature of issues on the international trade agenda and their local manifestation in Southern Africa. The increasing importance of institutions of governance and development is recognized and demonstrated by the interest in, and expectations of, NEPAD.

C. South Africa's Legal Framework

By its very nature a rules-based system, such as that of the WTO, will affect national legal systems when member-states have to comply with their obligations. The new disciplines of TRIPS and GATS also require more extensive domestic measures and "positive" obligations for members. The protection afforded to foreign IPR holders and service providers by necessity involves national ("beyond the borders") measures and new legislation.

The legal changes induced by the WTO disciplines had a more radical effect in South Africa's case. The inward-looking protectionist economic system that existed under apartheid had to be dismantled and a new democratic constitution adopted. South Africa's legal system has seen a lot of change since 1994 and although not all of this can be attributed to membership of the WTO, it has become much easier to deal with the legal needs of international trade under the present "international law friendly" Constitution and a legal order based on respect for the rule of law. The new approach to international law is reflected in South Africa's Bill of Rights, in the incorporation of international law into domestic law, the interpretation clause and several other provisions.

The Constitution is the supreme law of South Africa and all law and conduct inconsistent with it is invalid, and all obligations imposed by it must be fulfilled.[44] It also contains a comprehensive Bill of Rights which is justiciable and which the courts have to interpret in a manner that will require respect for and application of international law. For example, Section 39(1) of the Constitution requires a court when interpreting

[42] Presidents Mbeki (South Africa), Obassanjo (Nigeria), Bouteflika (Algeria) and Wade (Senegal).

[43] Stephan Gelb, *The Partnership for Africa's Development (NEPAD): A Brief Overview* , GLOBAL INSIGHT (June 2002).

[44] *Constitution*, Section 2.

the Bill of Rights to consider international law and permits it to consider foreign law.

The Constitution provides the framework for the conclusion and incorporation of international treaties and the role of customary international law in municipal law. Under Section 231(1) all international agreements are negotiated and signed by the national executive. Provinces may, therefore, not conclude international agreements governed by international law.[45]

Domestic procedures may also be necessary before agreements can enter into force. Under Section 231(2) of the Constitution, an international agreement binds the Republic only "after it has been approved" by both the National Assembly and the National Council of Provinces. Certain agreements do not, however, require parliamentary approval. Technical, administrative and executive agreements or those not requiring ratification or accession will enter into force in the manner prescribed by the agreement itself and will bind the Republic without parliamentary approval.[46] The only requirement is that they must have been entered into by the national executive. Bilateral and "technical" trade agreements fall mostly into this category. The classification of these agreements is not explained in the Constitution. The descriptions in section 231(3) of the Constitution are legal and technical terms and their meaning has be ascertained through international and comparative sources[47] and by studying the practice that has developed under the new constitutional order.[48] Ultimately these are legal and constitutional issues that the courts will have to decide and international law will inform the decision of the court.[49]

Agreements not requiring parliamentary approval have to be tabled in Parliament within a reasonable time, but a failure to comply does not affect the validity of the agreement.

The domestic application and enforcement of agreements is a different matter. Section 231(4) requires prior legislative enactment by way of national legislation unless the provision is self-executing and part of an agreement approved by Parliament. National legislation includes subordinate legislation.[50]

Customary international law "is law in the Republic unless it is inconsistent with the Constitution or an Act of Parliament."[51] No legislative incorporation is required; thereby reflecting the monist approach. International trade law is, however, for all practical purposes treaty law[52] and this provision is seldom of direct relevance to the application of trade agreements in South Africa.

[45] Provincial governments can, however, enter into arrangements with their counterparts elsewhere on matters such as tourism, cultural affairs, technical cooperation, etc.

[46] *Constitution*, Section 231(3).

[47] *See, e.g.*, Luzius Wildhaber, *Executive Agreements*, in ENCYCLOPEDIA OF PUBLIC INTERNATIONAL LAW 81–86 (1984) and the citations there. "Self-executing" agreements are mostly recognizable from the text and the intention of the parties. The jurisprudence on "direct applicability" of treaties in the EU is quite extensive and carries a similar meaning to "self-executing".

[48] The Department of Foreign Affairs uses a "Manual" for classifying agreements and for deciding whether to submit them to Parliament for approval.

[49] Section 232 of the Constitution provides that customary international law is part of South African law. The Vienna Convention on the Law of Treaties constitutes a codified source of the law on international agreements, their entry into force, interpretation, reservations, consequences of violation, etc. This Convention is, therefore, an important source of law for South African courts for the purposes of interpreting constitutional provisions on international agreements.

[50] *Constitution*, Section 239.

[51] *Constitution*, Section 232.

[52] JACKSON, DAVEY & SYKES, LEGAL PROBLEMS OF INTERNATIONAL ECONOMIC RELATIONS, 269 (1995).

South Africa has deliberately chosen to be "international law friendly." Section 233 of the Constitution reads: "When interpreting any legislation, every court must prefer any reasonable interpretation of the legislation that is consistent with international law over any alternative interpretation that is inconsistent with international law."

This provision makes international law a legal source to be consulted by the South African courts in contrast to the traditional presumption of statutory interpretation which could only be invoked if the legislation was ambiguous.

South Africa has also moved away from the unitary state approach of the previous system and has adopted a *sui generis* species of federalism. South Africa now has nine provinces with their own legislatures and executives. Their powers are listed and enumerated in separate schedules to the Constitution. The residual powers remain with the national government, including the power to negotiate international agreements. The provinces do not have the power to enter into international agreements and have not had a very active role in their negotiation and conclusion. The Constitution does recognize the principles of "cooperative government"[53] but the provinces' role in international treaty-making is limited. Provinces are, however, part of the national legislature with provincial delegations constituting the "second chamber", the National Council of Provinces, which is constitutionally required to concur in the approval of international agreements.[54]

D. South Africa's International Economic Legal Framework

South Africa is a member of a comprehensive and complex set of international economic arrangements which include bilateral, regional and international agreements. It is not only a member of the WTO but also of the International Monetary Fund and the World Bank, as well as the latter's principal associated organizations: the International Finance Corporation and the International Development Association.[55] South Africa is also party to various protocols to the General Agreement on Trade in Services (notably relating to trade in basic telecommunication and financial services). It is also a member of several international organizations protecting intellectual property rights. The TRIPS Agreement has been largely incorporated into domestic law.

South Africa's regional relationships were complex under apartheid and that too changed after 1994. The country became a Contracting Party to the revised Fourth Lomé Convention concluded between the European Community and the group of African, Caribbean and Pacific states. However, with a more developed economy, South Africa does not benefit directly from this agreement, and a separate Trade Development and Co-operation Agreement was concluded between South Africa and the European Community in 1999.

South Africa is now an active member of the Southern African Development Community ("SADC"), and has remained the dominant player in the Southern African Customs Union ("SACU") Agreement. This Agreement has been in existence since 1910 and was revised in 1969. The political change in South Africa required the SACU Agreement to be renegotiated and the new Agreement entered into force July 15, 2004.

The domestic application of these agreements is not entirely clear. In terms of the Constitution such agreements have to be incorporated into municipal law by way of national legislation in order to have domestic effect. National legislation may include

[53] *Constitution*, Ch 3.
[54] *Constitution*, Section 231(2).
[55] Daniel Bethlehem, *International Economic Relations*, in DUGARD *supra* note 11, Ch 19.

subordinate legislation.[56] With respect to international agreements South Africa therefore still follows the dualist tradition. South Africa's trade, financial and economic agreements have, however, largely not been enacted into municipal law.[57] The WTO Agreement, for example, was approved by Parliament under the Interim Constitution on April 6, 1995, but has not been comprehensively enacted into municipal law. This position is complicated as substantive parts of these agreements have been enacted into national legislation, yet other provisions remain outside of the domestic legal framework.

In the field of intellectual property, South African statutes appear to have been drafted with the TRIPS Agreement in mind.[58] The South African Department of Trade and Industry also seems to adopt an approach that keeps domestic legislative and administrative procedure in line with its WTO obligations. The Department has recently published for public comment new Anti-Dumping Regulations. These Regulations incorporate the Anti-Dumping Agreement of the WTO into national legislation and grant the necessary power to domestic structures to implement the applicable international principles within a South African legal framework.

This particular area of South African law is, however, undergoing a crisis of development. The Supreme Court of Appeal recently rendered an unfortunate decision on the application of international trade agreements domestically in a case on the enforcement of rules of origin in international agreements.[59] The Court held that:

> If there were to be an apparent conflict between the general provisions of the statute and particular provisions of an agreement, difficulties of interpretation might indeed arise. The act must, of course, prevail in such a case: An agreement once promulgated is by definition part of the Act. It must follow that where words which are defined in the Act occur in the Agreement, there must be given the meaning assigned to them by the Act unless the context indicated the contrary.[60]

This is clearly unsatisfactory as the judgment creates an uncertainty with respect to the extent of incorporation of international trade agreements. Hopefully this will change as other structures exist under the current constitutional structure to redress the situation, such as the South African Law Commission, Parliament or the Constitutional Court. The rules-based trading system requires not only inter-state respect for international obligations, but that effect be given to their obligations internally. This is especially true in respect of international agreements on trade in services and the protection of intellectual property rights. International trade law is increasingly involved in domestic areas and beyond border measures, and requires positive legislative and administrative steps by governments. The somewhat awkward result is that South Africa has a comprehensive Constitution, but unfortunately it is not implemented to give full effect to the incorporation of international trade obligations.

Domestic implementation of trade obligations is a serious and burdensome matter common to developing state members of the WTO. In most instances the state is required to adopt new legislation, create new institutions and procedures. Obvious examples are TRIPS and GATS, but even traditional subjects of international trade law such as anti-dumping, safeguards, countervailing duties and customs require extensive

[60] *Id.* at 15.

and effective domestic arrangements in order to reap the benefits of these multilateral disciplines.

South Africa has been fortunate to have undergone considerable legislative modernization since the election of its new government; ranging from far-reaching changes to the structure of government, competition legislation, statutes guaranteeing administrative justice and access to information,[61] employment equity and the restructuring of sectors of the economy to promote black empowerment. South Africa has not adopted a radical approach to land redistribution or nationalization of the mining industry. It has dealt with these sensitive issues through restructuring and redistribution policies in partnership with business and labor and in concord with specific growth and employment targets.[62]

With the International Trade Administration Act, South Africa has enacted legislation to directly administer international trade.[63] This Act repeals legislation providing for the Board on Tariffs and Trade and Import and Export Control. It creates a Trade Administration Commission responsible for matters such as anti-dumping, countervailing duties and safeguards.[64] The Commission is further tasked with the implementation of the new SACU Agreement of 2002. Section 15(2) provides that the Commission "must carry out any function that arises out of an obligation of the Republic in terms of a trade agreement, if the Minister [of Trade and Industry] has assigned that function to the Commission."

The Commission is a statutory organ and, as such, has to comply with the principles of administrative justice including transparency, fairness and providing reasons for decisions.

The Constitution further provides for the freedom of trade in section 22 which reads:

> Every citizen has the right to choose their trade, occupation or profession freely. The practice of a trade, occupation or profession may be regulated by law.

This provision has not yet been interpreted by the courts in the context of international trade. This is one of the few fundamental rights in the South African Constitution which is limited to "citizens"[65] and may pose an obstacle to some of the GATS provisions on mode four as well as the national treatment requirement.

This overview provides a picture of certain aspects of the South African legal landscape and the relationship to international trade. This has not come about as a direct result of WTO membership; but it does reflect the extent of important internal change. This provides an adequate framework for dealing with the new demands related to the domestic implementation of international trade obligations. Actual practice will further the domestic implementation of South Africa's trade obligations. The framework exists, but the necessary understanding and adaptation to the new rules of the game have not yet materialized to the extent required.

[61] The promotion and protection of administrative justice and access to information are constitutional obligations that had specific time periods for legislative enactment under Sections 32 and 33 of the Constitution.

[65] The other citizen-specific rights are the right to a passport, political rights and citizenship. All other rights in the Bill of Rights are made available "to everyone."

IV. South African Attitudes towards the WTO

The WTO is not a familiar concept to most ordinary South Africans and many will not even know what the acronym stands for. The reason is that there are still more pressing issues, such as the reconstruction and development of society and dealing with the legacy of the apartheid past.

The term "globalization" evokes a more emotional response, and while not always used consistently, is a more familiar term to South Africans. There are a fair number of South Africans who share the view that globalization, trade and multinationals are bad and responsible for environmental degradation and consumer exploitation. This view is not shared by most political and business leaders. There is a clear understanding that South Africa needs growth, development and employment opportunities and that trade and investment are essential prerequisites for achieving government goals. This is reflected in the economic policies of the government, in legislation, active participation in trade negotiations, both in Geneva and regionally, and in actual business practices.

Some sectors maintain a more critical view of the WTO disciplines. Certain trade unions will blame job losses in, for example, the textiles industry, on "unfair trade" instead of other probable factors such as the need to become competitive under global challenges.

Just as there cannot be one single view on the WTO (or globalization), South Africans also have varied opinions. South Africans in general desire the benefits of a prosperous society, the freedom to travel internationally and a clean environment. Those more knowledgeable about international trade (and remembering the effects of isolation under apartheid) will recognise the advantages of active participation in the international economy; without losing sight of the fact that the local economy displays certain peculiar features that require tailor-made solutions. WTO disciplines are not designed to be one-size-fits-all. Many criticisms against unfortunate consequences of international trade regimes, such as the controversy surrounding patents on essential medicines held by pharmaceutical companies in rich countries, will be shared by most South Africans. As the capacity to understand, apply and shape the rules governing international trade increases, adequate responses can be formulated. The new South Africa very much wants to be part of the bigger world, but is also acutely aware of the poverty and deprivation of many in Africa. These unfortunate conditions add to many structural consequences such as weak governments and misery for individuals. These important factors also have direct consequences for the rich and developed nations and their security; the "oneness" of the world makes it impossible for international peace and security to exist alongside pockets of squalor and collapsing governments.

V. A South African Perspective: Strengths and Weaknesses of the WTO

Any evaluation of this kind should start with some identification of possible criteria. What does the WTO purport to be and how does it differ from its predecessor? How has the WTO interacted with South Africa with its peculiar needs and expectations? Where do we stand with the "development agenda"?

An attractive feature of the WTO regime is that it is a rules-based system. This means, in principle, that the typical qualities of law, such as legal certainty and predictability, have replaced strong-arm tactics and reliance on bargaining power. In trade negotiations, power relationships have obviously not disappeared altogether but have been constrained within a legal framework, the justiciability of existing arrangements being a positive

consequence. The fact that the WTO is a single undertaking makes the outcomes of negotiations in principle more balanced and inter-connected.

From a South African viewpoint, a weakness of the GATT system has been retained by the WTO. Developed states that are better at "playing the system" gain advantages over those less able. This may not be conclusive evidence of a systemic bias against developing countries or that the system should be "democratized". An inter-governmental organization of sovereign states is not about democracy in the sense of power legitimated by popular sovereignty and regular elections in the liberal-democratic tradition. It is a forum for states to exercise their sovereign powers to arrange matters of mutual interest.

It is true, however, that a system such as the WTO, which purports to be subject to the rule of law, must face certain logical consequences. One is access to justice. Justice should not be denied to certain members simply because they lack the necessary means or capacity. Just as access to justice is made effective in national systems through the provision of legal aid to indigent individuals where the interests of justice so require, states without funds or the necessary capacity to represent themselves should be assisted. They should be assisted to avail themselves of the protection of the law and the benefit of an impartial forum determining their case. This is hopefully recognized through the contemporary emphasis on "capacity building".

These arguments are to some extent accepted in the WTO and technical assistance is available. The establishment of the Advisory Centre on WTO Law[66] is proof of a commitment to developing countries. However, technical assistance is still too much a matter of theoretical, seminar-based training, as opposed to long-term and effective capacity building through the establishment of suitable and lasting institutions in developing and least-developed member states. There were indications (in the early stages at least) during the Doha "Development Round" that capacity was recognized as a pre-condition for a rules-based system to function with legitimacy. The criticism of a democratic deficit can best be answered by ensuring balance in both the content and enforcement of the law of the WTO.

The WTO is based on a complex set of legal instruments. This may well be inevitable given the nature of the subject matter to be regulated and the intricacies of policy and scientific standards. Yet this is further reason for well-targeted capacity building programs. The law should not become an elitist instrument of obfuscation.

How is the ordinary citizen affected by the practice of the WTO? What is the impact on an average business in a small economy that is eager to experience "growth through trade?" Will it not have to run the gauntlet of scientific standards unfamiliar to the local industry and complex rules of origin that make "trade preferences" meaningless? The attractiveness of a rules-based system is then undermined by its own complicated manifestations.

The private firm cannot directly experience justice in a government-dominated dispute settlement system such as the DSU. Governments may not be the entities actually trading, but they are the only parties that enjoy standing before the DSB. And the possibility of filing *amicus curiae* briefs does not alleviate this deficit as governments must first take up their citizens' complaints.

A possible answer lies in involving the private sector more directly in the various aspects of WTO activities. This is a task for member governments, especially as they are quick to point out that the WTO is a "member-driven organization", a claim enthusiastically echoed by WTO officials in Geneva. Why should civil society be excluded from training programs? Why do only the United States and the EU provide a formal legal

[66] The web site of the Advisory Centre is: www.acwl.ch.

channel for their citizens to redress trade grievances? Private firms or individual complainants do not, as a rule, enjoy standing before international tribunals and cannot bring claims against foreign governments in such fora, despite the fact that they are usually the victims of violations of international trade agreements. In disputes involving foreign governments they have to convince their own governments to take up their claims and pursue the matter via diplomatic channels or institute claims before international dispute resolution bodies. States may exercise diplomatic protection[67] on behalf of their nationals or there may be specific municipal devices for pursuing international claims on behalf of domestic firms and individuals. This latter possibility does not exist in South Africa while the multinational giants of the United States and the European Union enjoy active support from their governments.[68]

There are other popular criticisms that involve other international trade agreements. The policy of the EU and others on highly subsidized farming sectors in rich countries can never be justified. These aberrations in the trade in agriculture are contained in the current law of the WTO. Arguments for "protecting traditional lifestyles" are insults to the millions in poor countries who are prevented from rising to experience a lifestyle of any quality. That is why they should be forgiven the same cynicism when hearing of the sudden upsurge of interest in and revival of geographical indications. South Africa had a particularly rude awakening in this regard when it negotiated its bilateral Trade, Development and Co-operation Agreement with the EU. A refusal to allow Spanish and Portuguese fishing fleets access to South African waters resulted in usage of the terms "port" and "sherry" being denied to a country that has produced these particular elixirs in some cases for over a hundred years.

VI. South Africa's Participation in the Dispute Resolution System

South Africa has not yet been involved in a formal dispute under the DSU. It has welcomed this particular development and outcome of the Uruguay Round, but has not been a complainant, defendant or third party. Why is this so?

A tempting response is that the country has not yet had a serious trade dispute or that it managed to resolve them through consultation. An active litigation strategy is probably not a priority for Pretoria, mirrored by its approach to adjudication in the SADC region where the preference is for direct consultations with trading partners.

This may have to change. Even consultations can be more effective when backed up by an effective dispute resolution system. It is also necessary in the light of the possibility of disputes being brought to the DSB by other developing countries against South Africa. South Africa is an eager practitioner of anti-dumping measures. Exporters from developing countries are increasingly on the receiving end of anti-dumping measures imposed by governments of other developing countries. South Africa has not escaped this trend. In April 2003, Turkey filed a request for consultations with the DSB

[67] On the possible use of diplomatic protection under South African law, see Gerhard Erasmus and Lyle Davidson, *Do South-Africans Have a Right to Diplomatic Protection?* 25 South African Yearbook of International Law 113 (2000).

[68] American citizens enjoy the rather wide protection provided for by Section 301 of the U.S. Trade Act of 1974, as amended. They can petition the U.S. government for assistance against foreign governments that violate trade agreements. Since 1994 the EU has a similar arrangement. *See* Chapter 11 of this book and John H. Jackson, The World Trading System: Law and Policy of International Economic Relations 127–132 (1998).

concerning anti-dumping measures imposed by South Africa on blankets exported from Turkey.[69]

There are several reasons for adopting a more pro-active policy on participation in the DSB. It is not possible for South Africa to effectively prevent claims against it. The development of expertise in this regard may prove to be a valuable asset, not only for defending and instituting claims, but also to enable the government to protect its interests as a third party[70] and be better prepared to assist its own nationals and firms in foreign disputes. It is part of the attractiveness of a rules-based system that decisions by independent fora establish an accepted international content on the meaning of rules. This strengthens the system. No member of the WTO can afford to deny itself this advantage.

VII. South Africa's Aims for the Doha Round

The Doha "Development" Round is an important opportunity to continue a process of global trade reform; started during the Uruguay Round, with the specific aim of addressing a number of issues of particular concern to developing countries.

The South African government views the Doha Round as an opportunity to achieve a fundamental structural adjustment to the development paradigm in international trade. The discussions during this Round concern broader issues and are not only limited to "pure" trade issues. For South Africa the debate is about very crucial issues of statehood and the quality of life of millions of Africans. There are certain aspects of poverty and underdevelopment that can be addressed by a deliberate process of directing resources from the developed to the poor. Such an approach is akin, so it is argued, to the structural developments funds used in, e.g. members of the EU.

The South African Minister of Trade and Industry has summarized the basic point of departure along the following lines:[71]

> The next round of negotiations must ensure structural changes in both the developed world and the developing world. Why is this? In the next decades, in the coming millennium, the impetus for growth in the world economy will not come from the developed countries (the G7) as they cannot attain sufficiently high growth rates. If the developing world wants to penetrate the markets of the G7, we will inevitably end up with zero sum game.
>
> This would impel us toward structural protectionism in the G7. If the developed world is not growing rapidly, if the developing world does not offer a dynamic and growing market, and if the developing world seeks its markets only in the developed world, then we run the risk that developed countries will inevitably, through internal political processes, be pressured into seeking agreements that merely serve their own narrowly defined interests. Their objective will be to create economic space for growth when, in fact, that space for growth will not be achievable within the structure of the world economy I have just described.
>
> In these circumstances, no matter the inherent quality of an agreement (for example, electronic commerce, TRIPS, multilateral investment arrangements), these can easily become mechanisms whereby the developed world seeks to reinforce its own advantages over developing countries at a point in time.
>
> Against this background a number of specific issues can be mentioned that are important to South Africa:

[69] *South Africa—Definitive Anti-Dumping Measures on Blanketing from Turkey*, WT/DS 288/1, April 10, 2003.

[70] The experience of India since 1995 and its very active role in WTO disputes serves as an example.

[71] This summary is taken from a keynote address by the South African Minister of Trade and Industry, Alec Erwin, to the National Consultative Conference on Preparations for the Third Ministerial and the New Round of Multilateral Negotiations.

Negotiations on agriculture should involve structural reforms and the distribution of agricultural production in the world economy as a whole. Negotiations should focus on the structural location of agricultural production. (South Africa has cooperated actively with the Cairns group in developing strategies for this sector.)

South Africa favors a wider category of non-actionable subsidies to promote development goals.

South Africa seeks to ensure that the benefits of intellectual property regimes are equitably shared between the innovators/owners and users/consumers of technology. The protection of intellectual property rights should encourage innovation and technological development whilst being conducive to meeting public and social policy objectives. South Africa requires that the protection of bio-diversity, food security, and access to essential drugs be clarified, as well as the definition, scope and modalities for non-violation complaints. The protection of geographic indications and the protection of other intellectual property rights should not undermine the benefits of a more open and competitive international trading environment.

South Africa favors a comprehensive approach to multilateral trade negotiations that includes industrial tariff negotiations. South Africa's objective is to ensure the reduction and elimination of tariff peaks and tariff escalation on products of export interest and in value-adding sectors that can build upon the comparative advantages of the developing countries.

South Africa recognizes that competition policy and law in developing countries form part of a broader policy framework, including meeting public policy objectives. As these considerations raise a complex set of issues, South Africa attaches great importance to the ongoing "educational" process underway in the Working Group on Trade and Competition Policy. Work in this area should be intensified, with particular emphasis on its developmental dimensions and the financial, human, institutional and juridical implications of competition policy and law should be examined at both national and multilateral levels.

As far as Transparency in Government Procurement is concerned, it is South Africa's view that commitments to transparency will add to the financial, institutional and administrative burdens of developing countries, and that the provision of adequate technical and financial support should be incorporated into disciplines in a meaningful application of special and differential treatment. Measures to improve transparency should not constitute efforts to achieve market access goals nor impinge on practices to address domestic development concerns. Any multilateral arrangement in this area should be in the form of non-binding guidelines that are not subject to the dispute settlement mechanism. Domestic or regional review mechanisms should be employed for any dispute which may arise.

On Trade Facilitation there is agreement that the simplification of trade procedures has the potential to save time, money, human and other resources and could result in substantial benefits for all economies. Efforts to improve security and predictability for traders, including trade facilitation, are welcome, but the realities of trade impediments in many developing regions (underdeveloped and poor customs administration procedures, documentation and infrastructure, etc.) are not best addressed by binding commitments in the WTO subject to dispute settlement. What is required is a comprehensive and integrated effort in technical cooperation, financial support and human and institutional capacity building.

Electronic Commerce, largely a GATS issue, has greatly enhanced the relevance of the cross-border mode of supply of services and has underlined the importance of implementing the commitment to provide developing countries with improved access to technology and information networks to underpin their increased participation in the world trade in services. South Africa supports the continuation of the work program on electronic commerce and calls for technical assistance, training and the development of infrastructure to enable developing countries to participate and benefit from electronic commerce. Extension of the standstill on the non-imposition of customs duties on electronic transmissions should be accompanied by the availability of technical assistance. Infrastructure and capacity constraints, connectivity, and access to hardware and software are critical issues for developing countries.

> South Africa attaches great importance to the ongoing discussions in the Committee on Trade and Environment with a view to resolving the issues related to the interface between trade and environment policies. Given the complexity of the issues and the concerns raised by many members, it is South Africa's view that it is premature to include the issue of trade and environment in the forthcoming negotiations where the prospects for a positive outcome are minimal. It could also undermine progress on the other issues.
>
> South Africa endorses the principle of core labor standards as enshrined in the ILO conventions, but rejects the use of labor standards for protectionist purposes. It is South Africa's view that efforts to bring labor standards under the WTO disciplines, where they would be actionable under the DSU, would fatally undermine any multilateral progress, not only on the issue of labor standards themselves, but also on every other issue under consideration in the WTO. Labor standards should consequently not form part of the proposed negotiating agenda for the New Round.

The above is a comprehensive list that resembles many of the demands of other developing nations. What may be different is the emphasis on the connection between the need for structural adjustment in particular economies and the logic of a global, rules-based trading system. Both rich and poor face the need to adjust, both rich and poor stand to loose from a failure to do so; albeit in different ways. The global system itself will suffer negative consequences if this aspect is not addressed. This is an important implication of the South African argument.

How effective and persuasive are these arguments? Do other leaders share this view? The next section (on strategy) discusses the South African approach, but the validity of the South African views depends on more than their moral quality. They have to persuade the developed world amidst changing perceptions on the role of governments in developing nations, an emphasis on domestic governance and the rule of law.

The benevolence of the post-colonial era has been replaced by the realism underpinning the Washington Consensus and enforcement of rules. This poses challenges for the moral leadership of South Africa's African role, as reflected in the NEPAD initiative. The latter, however, still suffers directly from the perception of the inability of African leaders to solve the present crisis in Zimbabwe.

New perceptions on international security after the terror attacks in the United States on September 11, 2001 and the War in Iraq may result in different considerations and tougher approaches by, for example, the United States. But they also offer scope for the argument on the link between stability and international peace, and the need to halt the wider consequences of poverty and decay of effective government in African states.

Some developed nations will agree with the wider structural implications flowing from the Doha agenda. They will, however, differ on where to put the emphasis. Judging by the debates before Cancun and the lack of progress made so far, most developed countries do not seem to be prepared to accept the structural changes required by the South African vision. The common agricultural policy of the EU and protection of multinational pharmaceutical companies seem, for example, to be no-go areas. Hopefully changes in attitude will follow as the negotiations continue. For this to happen, the negotiation process itself, the necessary momentum and a sense of urgency will have to be advanced.

VIII. The Strategy for Achieving these Objectives

South Africa, as a part of the developing world, supports a broad and balanced agenda for Doha. It favors the "single undertaking" approach where negotiated results should be adopted in their entirety.

Political leadership is an important determinant of South African policy-making. This informs the underlying assumptions of the NEPAD initiative which emphasizes that governments must take responsibility for the future of their states and people. Trade Minister Erwin has, however, also stated the following on the role of leadership as an element of a new strategy:

> I would suggest that the best way of integrating the developing countries into the world trade system is for the developed countries to engage in a serious discussion in their own societies about the structural adjustments that their economies have to undergo.[72]

Solidarity among developing countries in the Doha negotiations is seen as another important strategic advantage. For this they need to develop "a counter-weight capacity to the powerful influence that the G7 has on the world economy."[73] This requires a "capacity to negotiate." Developing countries have to come together and specialize where their strength lies. The WTO system as a complicated international trade arrangement requires expertise to be successfully utilized to maximum advantage. This may be obvious, but is difficult to realise. The developing world displays many divergent needs and preferences.

South Africa favors equity and sustainability in the world economy and supports the protection of the environment and labor rights although not necessarily through the WTO. Different negotiations should be "disentangled" and the relationship between key organizations such as the WTO, UNCTAD, ILO, IMF and the World Bank should be clarified. Environmental protection, sustainability and labor and social rights should receive proper protection, but should not be perceived "to be matters of negotiating advantage for the commercial or economic benefit of a group of countries against another."[74]

The South African government supports the rules-based nature of the world trading systems and seeks to protect and strengthen its integrity. However, a rules-based system is more than a formal structure. If substance, justice and equitable objectives are not part of such a system of law, a dangerous illusion will be the result.

It is imperative that economic interactions in the world economy are governed by a system of rules, not by the interplay of economic or military power. At the same time, it is imperative that rules are designed to achieve clear and equitable objectives. If there is no clarity and agreement on these objectives, and if there is no agreement on the need for the objectives to be equitable, then the very real danger will be that the world system functions on the basis of the interplay of power, under the guise of rules.[75]

IX. Effects of Regional Trading Arrangements

There have been a number of important regional trade developments in Southern Africa since the political changes of 1994. A new Southern African Customs Union ("SACU") Agreement has been concluded and entered into force on July 15, 2004. This agreement reforms the almost century-old customs union[76] and attempts to scale down the dominant role that South Africa played under the 1969 agreement. The preamble recognizes that

[72] *Id.*
[73] *Id.*
[74] *Id.*
[75] *Id.*
[76] SACU came formally into existence in 1910 and includes Botswana, Lesotho, Namibia and Swaziland as the other members. There were also customs arrangements in the late nineteenth century between the former Boer Republics of the Transvaal and the Orange Free State. Some of them included neighboring colonies of that time such as Swaziland.

the 1969 agreement could no longer "adequately cater for the needs of a customs union in the 21st century and should therefore be aligned with current developments in international trade relations." There is now considerable emphasis on common policies and common institutions.[77] They aim to function with greater independence and should ensure that SACU becomes a more balanced member-driven body and an effective vehicle to administer the liberalized common market.

The basic objectives of the Agreement are:

- To facilitate the cross-border movement of goods between the territories of the Member States;
- To create effective, transparent and democratic institutions which will ensure equitable trade benefits to Member States;
- To promote conditions of fair competition in the Common Customs Area;
- To substantially increase investment opportunities in the Common Customs Area;
- To enhance the economic development, diversification, industrialization and competitiveness of Member States;
- To promote the integration of Member States into the global economy through enhanced trade and investment;
- To facilitate the equitable sharing of revenue arising from customs, excise and additional duties levied by Member States; and
- To facilitate the development of common policies and strategies.[78]

Two specific challenges face the customs union. The first is to administer the Common Revenue Pool[79] under conditions where the tariff revenues of the dominant state party, South Africa, is sharply declining because of its Trade, Development and Cooperation Agreement ("TDCA") with its largest trading partner, the EU, approved in 1999. The second challenge is a consequence of the TDCA, which provides for bilateral trade and development assistance outside the Cotonou Agreement, to which all other SACU and SADC members belong. The common market spreads the impact of the provisions of the TDCA to the other SACU members. These member states were, however, not directly and substantially involved in the negotiations conducted with the EU. The implications have now been acknowledged as SACU, and not just South Africa, is now involved in the negotiation of an FTA between the United States and SACU.

In 1994 South Africa also joined the newly reconstructed Southern African Development Community ("SADC"). The implementation of SADC's trade protocol, together with several other protocols on infrastructural development, addresses the uneven development that characterize the region. A matter of considerable legal interest will be whether the dispute resolution mechanism will be activated and allow for a more comprehensive rules-based approach.

Southern Africa faces the challenges of overlapping membership[80] of different regional organizations and demands for negotiating new Economic Partnership Agreements

[77] Such as the Council of Ministers, the Commission, a Secretariat to be housed in Windhoek, the Tariff Board, Technical Liaison Committees and the Tribunal.

[78] *South African Customs Union Agreement*, Article 2.

[79] For most members except for South Africa, customs revenue is an important source of national revenue.

[80] The five SACU members are all members of SADC, which has fourteen members. All SADC members, excluding South Africa (which has qualified membership), are full partners with the EU under the Cotonou Agreement, while South Africa has concluded a separate bilateral agreement with the EU. All of these states are members of the WTO.

("EPAs") with the EU,[81] as well as an FTA between the United States and SACU. These developments all impact on the multilateral trade framework. Whether Article XXIV of GATT 1994 can in its present form accommodate all the ensuing tensions and systemic implications looks uncertain. Furthermore, the direction of these regional initiatives are influenced not only by trade and economic factors, but are designed to address regional political and security considerations.

A subtle but potentially significant new dimension has entered into the Southern African regional trade arrangements that affects the power relationships. It came about not only as a result of the end of apartheid, but also as a result of the end of tensions between South Africa and its neighbors. The fact that South Africa is now a member of SADC and that a new SACU Agreement is in place, brings it under the disciplines of these arrangements. Southern African trade is now based on a rules-based arrangement; albeit still in its early stages of active implementation. Formal dispute resolution mechanisms exist on paper but are not yet in operation. The SADC Tribunal is, for example, not yet operational and the SACU Tribunal is still to be established.

This passivity may soon change. The logic of a rules-based regional trade system will then result in new practices, formal dispute resolution and different modes of interaction. South Africa will be wise to support such developments; they fit together with the bigger global picture and South Africa's desire for multilateral interaction.

X. The Development of Trade Policy

Trade and industrial policy is primarily formulated within the government. The formal structure for trade policy development is to be found in the relevant constitutional and legislative provisions which provide that the "executive authority of the Republic is vested in the President", who exercises this power together with the Cabinet.[82] This includes "developing and implementing national policy" as is typical of a Cabinet style of government rooted in the British tradition. The responsible government arm is the Department of Trade and Industry ("DTI").

The International Trade Administration Act allocates specific powers to the Minister of Trade and Industry as the "head representative" of the Republic in consultations with other SACU countries. This Minister may also "by notice in the Gazette . . . issue Trade Policy Statements and Directives."[83] The International Trade Administration Commission assists the Minister in this function.

Government is committed to transparency and a process of public participation.[84] The Trade and Industry Chamber of the National Economic Development and Labour Council ("NEDLAC") supports the DTI in formulating South Africa's trade and industrial policy. It serves as a mechanism through which DTI officials can receive input from labor and business constituencies. The consultative process offers an opportunity to test reaction to the DTI's proposed policies.

[81] South Africa will not be involved in the latter as the TDCA is in fact an EPA. The exact format of the proposed EPA is uncertain. There is support for maintaining SADC as a single entity and the party to an EPA with the EU. This will pose major challenges on how to accommodate South Africa, which has already concluded a separate EPA with the EU in 1999.

[82] *Constitution*, Section 85.

[83] *International Trade Administration Act*, Section 5.

[84] Recent examples are the notices published in the official Government Gazette inviting the public to comment on the newly drafted anti-dumping regulations and the content of Doha negotiation positions.

In addition to its representation in NEDLAC, organized business enters the trade and industrial policy debate through the President's Economic Advisory Council. Labor has another route of influence as the ruling party, the African National Congress, the South African Communist Party and the Congress of South African Trade Unions constitute a political alliance.

DTI is in principle receptive to initiatives on trade and investment issues from other departments and agencies, such as the Departments of Finance, Agriculture, National Health, and Mineral and Energy Affairs, and the South African Reserve Bank. Proposals and recommendations to the DTI also come from the former Board on Tariffs and Trade ("BTT") and the Industrial Development Corporation ("IDC"). The IDC, for example, assists the DTI in carrying out periodic reviews and assessments of trade policies. South Africa's trade and industrial policy can be influenced by the work of Parliament and the various Parliamentary Committees where government and opposing political parties engage in debate and where public participation is constitutionally mandated.

A remaining problem is the low level of active involvement of particular sectors in proactive initiatives. It is crucial that the private sector, as the ultimate beneficiary, become involved when government negotiates new FTA's or formulates negotiating positions in the WTO. The outcome of such developments is, as a rule, a binding legal obligation. The private sector will have to live and trade under these agreements, and support and lobby their government when disputes arise with foreign states. It is important to become involved in the early stages when such agreements are still being negotiated. There is wide-spread concern that this is not happening to a sufficient degree.

XI. Conclusion

South Africa has experienced dramatic changes over the last decade. It has undergone fundamental domestic change and reconciliation, as well as a process of re-integration into the world economy. The government began to play a leading role in the Southern African region and on the continent. But leadership brings challenges and difficult choices. South Africa increasingly faces the consequences and tensions that flow from its leadership role, coupled with the demands of its own economy for growth and development.

The South African economy continues with major reconstruction in order to obtain a fairer distribution of ownership and wealth. Unemployment and public health crises remain major difficulties. These constraints make it difficult to take all of the bold initiatives beyond its borders that may be required. It can, however, do considerably more to enhance trade liberalization in the region and to open its market to its neighbors. The adoption of a fair and enlightened regional trade policy is a major challenge for government. The role of South Africa under the new SACU agreement will also be carefully monitored by the other member states. The negotiation of Economic Partnership Agreements between the other SADC members and the EU will focus attention directly on South Africa and on the terms of its support for the SADC trade protocol.

The NEPAD initiative on the African continent further stretches South Africa's political leadership and resources. The next decade may well be the acid test for South Africa's trade policies and its political status will be tested by the extent of economic development, political stability and the movement of people in Southern Africa generally. South Africa, as the region's largest economy, bears the major responsibility and has the most serious interests.

The South African government tackles these challenges with considerable resolve. It will not be able to deliver on its promises and bring about the necessary structural changes unless the multilateral context is fully in tandem with local and regional developments. The WTO is a crucial forum and the Doha Round is a vital opportunity. It will not be in the interest of South Africa, the region or the African continent if it fails in its overall policy or development objectives.

I. Introduction

Ever since the modern multilateral trading system was established in the early postwar period, the United States has been a central player. At the close of World War II, when the system began to take shape, the United States was the world's preeminent economic power and most influential democracy. U.S. negotiators took a leading role in conceptualizing and negotiating the agreement that became the General Agreement on Tariffs and Trade (GATT). In the fifty-five years since then, the United States has been a sustaining force providing the essential support for trade liberalization to move forward, and yet also at times has been a maddeningly unreliable trading partner, starting with U.S. rejection of the ITO Charter in 1950.[1] U.S. ambivalence about foreign trade and globalization has always been strong.

In the years that followed the creation of the GATT, successive administrations participated as a major player in eight rounds of multilateral trade negotiations, culminating in the Uruguay Round which gave birth to the WTO. Over time, Congress changed from outright hostility, to apathy punctuated with distrust, to broad bipartisan support of trade expansion through multilateral negotiations. The U.S. economy grew more and more globalized, as U.S. manufacturing and jobs became more and more linked to imported inputs and external markets, and the United States became the world's largest per-capita importer. Foreign investors and the jobs they create became as visible a presence in the United States as U.S. investors were in countries abroad. In 1994, Congress voted by a large margin to approve the WTO Agreement. In 2000, the year after the Seattle Ministerial Meeting of the WTO, Congress voted by an overwhelming margin not to withdraw from the WTO.[2]

This chapter presents an account of U.S. participation in the GATT, the Uruguay Round of multilateral trade negotiations, and the WTO. It starts with the U.S. role in the negotiations which led to the GATT, and discusses how trade policy is made, the constitutional basis of trade decision-making and the relative roles of Congress and the executive branch, particularly the Office of the U.S. Trade Representative ("USTR"). It presents an outline history of the U.S. interaction with the GATT from 1949 through the end of the Uruguay Round and the enactment of the legislation implementing the WTO Agreement. The chapter concludes with a brief discussion of the launch of the Doha Development Agenda ("DDA") negotiations, U.S. objectives and negotiating authority, and the situation in the wake of the Cancún Ministerial Meeting of September 2003.

Today, U.S. policymakers face the same challenge as ever: making the case to the public that the national interest is served by open trade, mobilizing support for open trade and gathering the collective political will. Breaking out of years of deadlock, the new Bush Administration successfully cooperated with the EC and others to launch the DDA, and then succeeded in securing Congressional backing for "trade promotion authority" legislation to provide the necessary legal support.

[2] H.J. Res. 90, a joint resolution *Withdrawing approval of the United States from the Agreement Establishing the World Trade Organization*, sponsored by Representative Ron Paul (R-Texas), with Reps. Chenoweth, Coburn, Duncan, Metcalf, Ney, Norwood, Taylor and Traficant. Introduced March 6, 2000, referred to the House Committee on Ways and Means, considered by the Committee on June 8, 2000 and reported adversely 35–0 by the Committee on June 12, 2000 (H.Rept. 106–672). After two hours of debate the resolution was rejected by a roll-call vote of 56 in favor and 363 against. 146 Cong. Rec. H4793-4814, H4909.

Yet the old ambivalence has not disappeared. Steel, textiles and other import-sensitive industries are as active as always, joined at times by new groups raising new concerns. Each economic downturn means greater pressure against import expansion. And recent years have added a new strain to the policy mix—the possibility that exporting interests can achieve their trade expansion goals outside multilateral trade negotiations, through regional trade agreements. The way in which the United States meets these challenges in the coming years is critical to the success of the DDA and the future of open trade in the world at large. And it will determine whether and how the United States retains a leading role in the trading system in the years after the DDA has been concluded.

II. U.S. Leadership in Forming GATT

A. Postwar Revival of the Trading System

The story of GATT's formation starts from wartime planning by U.S. and UK economic policymakers on collaboration in reviving world trade and employment in the postwar era. In bilateral discussions from 1940 through 1946, they agreed to advance the concept of an international organization for trade to complement international financial organizations; the organization would be linked to multilateral negotiations on reciprocal reduction of tariffs.[3] At its first meeting in February 1946, the new UN Economic and Social Council (ECOSOC) then initiated the preparatory process for a world conference on trade and employment, including negotiation of a draft charter for an International Trade Organization (ITO).[4] ECOSOC invited eighteen key countries to be members of the preparatory committee for the world conference. In September 1946, the United States tabled a draft "Suggested Charter," which became the basis for discussions at the preparatory committee's first session in October–November 1946.[5] The United States also invited members of the preparatory committee to engage in a round of tariff negotiations.[6]

U.S. participation in the ITO negotiations had two bases in domestic law. The ITO Charter would be negotiated like any other international agreement, and submitted for approval afterward to the Congress. Tariff cuts provided in connection with the ITO, on the other hand, fell under the Reciprocal Trade Agreements Act ("RTAA") of 1934, which authorized the President to enter into reciprocal trade agreements and to proclaim tariff cuts to carry them out. The 1945 extension of this tariff-cutting authority, Harry Truman's first legislative success as President, permitted tariff cuts of up to a generous fifty percent from applied rates as of January 1, 1945.[7] Since the ITO could not be completed and ratified before the RTAA again expired on June 30, 1948, the tariff concessions would have to be implemented in advance of the rest of the package. This required a separate legal agreement, the GATT.

Doc. E/PC/T/33 (Oct. 1948).

[7] H. Hawkins and J. Norwood, *The Legislative Basis of United States Commercial Policy*, in STUDIES IN UNITED STATES COMMERCIAL POLICY (W. Kelly ed. 1963), at 104.

The first session of the preparatory committee agreed on the outline of a GATT, although the actual tariff negotiations did not take place until 1947, safely after the November 1946 elections.[8] The text of the GATT picked up the commercial policy provisions from the Charter, together with special provisions on tariffs. The negotiations on its text took place during and after the second session of the preparatory committee, culminating in the Final Act adopted at the conclusion of the second session on October 30, 1947.[9]

Then, at the World Conference on Trade and Employment in Havana, the core group that had negotiated liberal and nondiscriminatory rules for trade faced the demands of a wider and more diverse group of countries. The Havana Charter signed on March 23, 1948 included many compromises and exceptions. It satisfied neither U.S. free-trade perfectionists nor U.S. protectionists, and its provisions visibly permitted discrimination against U.S. exports for an indefinite period.[10] The Truman Administration submitted the Charter to Congress for two-house approval early in January 1949.[11] Congress did not hold any hearings on the Charter until April-May 1950. Meanwhile, domestic opposition increased, and the Marshall Plan and the fight against communism displaced the Charter in Administration priorities. When war broke out in Korea, the Administration jettisoned the Charter in favor of the fallback strategy of participation in the GATT. On December 6, 1950, the State Department announced that the Administration would not resubmit the Charter to Congress. The Charter was dead.[12]

B. The United States Settles for GATT

The GATT offered an attractive fallback for trade policymakers in the United States and elsewhere. In hearings in the winter of 1946–47, Congress had criticized the Administration for using reciprocal tariff authority to bootstrap the United States into joining another international organization. State Department negotiators listened and responded.[13] The GATT was consciously designed not to look like an international organization; its participants were described not as "members" but as "contracting parties," and the entity exercising its collective will was described not by any particular name but as the CONTRACTING PARTIES in all capital letters.[14] The Protocol of Provisional Application permitted every contracting party to keep its existing mandatory legislation (avoiding any need for the Administration to ask a hostile Congress to change the law). And as a tariff-cutting agreement the GATT itself fell well within the four corners of the traditional mandate under the Reciprocal Trade Agreements Act. When the State

[8] Zeiler, *supra* note 3, at 63 on linkage to elections.

[9] The Final Act included the GATT, the Protocol of Provisional Application provisionally applying the GATT, and the schedules of concessions of the preparatory committee members.

[10] E.g., Article 23 of the Havana Charter, which permitted the British Commonwealth to discriminate against dollar area exports in applying balance-of-payments restrictions.

[11] The State Department transmitted the Charter as a joint resolution, requiring a simple majority in both houses. In the House, it was referred to the Foreign Affairs Committee, and to the Committee on Ways and Means, which would have had to legislate changes in domestic law required by the Charter rules. Zeiler, supra note 3, at 133–134.

[12] The depositary of the Charter, the UN Secretary-General, did not receive any acceptances of the Charter. *Analytical Index*, *supra* note 4, at 6.

[13] Zeiler, *supra* note 3, at 75–84; Susan Aaronson, Trade and the American Dream: A Social History of Postwar Trade Policy (1996), at 69–72, 82–83.

[14] The inventor of this orthographic device was John Leddy, of the U.S. State Department Trade Agreements Division.

Department's Trade Agreements Division drafted the U.S. Suggested Charter in 1945–46, the drafters based the core substantive trade provisions (later to become the GATT) on the standard draft text used in the U.S. reciprocal trade agreements of 1930–1945.

The Truman Administration decided to support the idea of building the GATT into an effective, functioning arrangement to accomplish at least some of the goals set for the ITO. The GATT, originally just a stopgap, became the basis of an *ad hoc* institution that would have to survive by flexibility, consensus and compromise. Over the next 45 years there were to be many advances and setbacks in the road from that early GATT to today's WTO. Although the GATT quickly became an effective forum for negotiating tariff reductions, it would be years before serious effort went into trying to reduce non-tariff barriers, and longer still before the contracting parties decided to raise their level of ambition, venture into new areas of trade discipline, and construct a stronger rule enforcement mechanism. The United States played a critical role in that evolution, contributing both to the strengthening of the system and to some of its more disappointing failures. On occasion, opposition from powerful U.S. interests contributed to a breakdown in GATT rules and a failure to impose discipline. Yet American leadership also helped to ensure the necessary reforms that have so significantly strengthened the institution and its rules. Despite a grueling domestic debate echoing many of the same sovereignty arguments used against the ITO, the United States was instrumental in finally bringing into existence the more permanent and universal institution now known as the WTO.

III. Trade Policy Decision-Making in the United States

To better appreciate the relationship between the United States and the GATT/WTO system, it is important to understand the process of trade policy decision-making in the United States. The complex (and to outsiders at times baffling) system for negotiating trade agreements and regulating foreign commerce is a product of the distribution of powers in the U.S. Constitution of 1789. As a newly independent nation the United States had many commercial and cultural ties to Europe, but it also possessed a growing internal economy and vast natural resources. Trade concerns were central to the original formation of the United States, and were heavily influenced by a desire to avoid dependency on Great Britain or other European powers. Moreover, customs duties were originally the major source of revenue for the Federal government, a fact that did not change until introduction of the income tax in 1910.[15] As a result of these considerations, the country's original founders devoted much attention to the question of how to regulate foreign commerce.

A. The President and Congress—Constitutional Tensions over Trade

The Constitution's structure reflects the desire of its drafters to maintain a careful balance between competing economic and political interests. The principle of separation of powers was one means of ensuring that balance. This principle is evident in the creation of three distinct branches of government with their different roles and their areas of interdependence clearly spelled out in the Constitution. The role of Congress is primarily to legislate, but it also has certain powers over Presidential appointments. The role of the President is that of a chief executive, but he also has the right to propose and to veto legislation. The role of the judicial branch is *(inter alia)* to provide a check on whether

[15] *See* ALFRED ECKES, OPENING AMERICA'S MARKET: U.S. FOREIGN POLICY SINCE 1776, 49 (1995), table 2.1 on U.S. Customs duties and federal revenue: Customs duties represented 65 percent of total federal revenue in 1860, 41 percent in 1900, 31 percent in 1915, 14.5 percent in 1930, and 1.6 percent in 1992.

the President or the Congress has acted outside the scope of Constitutionally-conferred authority.

The separate but interdependent nature of the two branches is no less evident in the field of foreign trade, where the Constitution draws distinctions between the responsibilities of the two branches. The Constitution grants the President the sole power to make treaties (under Article 2, section 2) and accordingly the President has exclusive authority to *negotiate and conclude* international trade agreements. However, the Congress has plenary power under the Constitution to *regulate* interstate and foreign commerce and to authorize customs duties (under Article 1, section 8). As in the case of many other countries, the U.S. Constitution takes a dualist approach to international treaty obligations: no treaty obligation is directly applicable in domestic law, and generally treaties are carried out in domestic law through enactment of implementing legislation.

This Constitutional separation of powers has had a profound impact on U.S. participation in the GATT/WTO system. The President has been unable to carry out any negotiated tariff reductions or carry out agreements on non-tariff barriers to trade, unless Congress has either granted him in advance the authority to do so, or has approved the agreements afterwards and has passed implementing legislation. Conversely, the Congress cannot enter into negotiations with other governments, and must rely on the President to conduct such negotiations.

In parliamentary systems, the leader of the government is also the leader of the legislative branch, and can insist on support for the government's negotiating position from his or her own ruling majority. The government and the legislative majority are clearly and jointly responsible for trade policy decisions. But the American division of powers, as perfected by various delegations of power from Congress to the executive branch, facilitates the executive-legislative trade policy game so ably characterized by I.M. Destler:[16] Members of Congress can and do give voice to the interests of local industries, labor unions or other organized lobbies in trade policy matters, secure in the knowledge that the executive branch will prevent anything irretrievably bad from happening. As a corollary, many in Congress seek to retain as much domestic control over trade matters as possible, rather than agree to a formal surrender of power to an international body. This group of concerns, often described as relating to "sovereignty," animated the opposition to the ITO and other unhappy episodes, and remained a factor to be dealt with when the Clinton Administration sought approval in 1994 for the WTO.

One more structural feature of American government, the different composition of the two Houses of Congress, has had a profound effect on the politics of trade policy in the United States. The House of Representatives, apportioned by population, represents the populous states and the Rustbelt; for instance, in House debates the interests of energy consumers tend to prevail. But in the Senate, which has two Senators for each of the fifty states, the interests of the West, the Farm Belt and energy and natural resource producers have historically had a strong voice. To start or finish a round of trade negotiations, trade negotiators have had to mobilize broad support from both industry and agriculture—particularly agriculture.

B. Trade Negotiating Authority and "Fast-Track"

The collective memory of the trade policy community locates the zenith of Congressional control over trade policy in the Tariff Act of 1930 (often called the Smoot-Hawley Act after its principal sponsors), the last time that Congress ever crafted a general tariff bill

[16] *See* the classic AMERICAN TRADE POLITICS (1995), and other articles by Destler.

setting tariffs line by line. The Smoot-Hawley Act raised the average tariff on dutiable items to sixty percent and was widely blamed for the worldwide decline in trade in the 1930s. After this embarrassment, Congress periodically enacted statutes delegating to the President the authority (and implicitly the political responsibility) for tariff reduction.

The first delegation occurred through the Reciprocal Trade Agreements Act of 1934,[17] which granted specific authority to the President to negotiate reciprocal trade agreements with other countries and to proclaim reductions of the U.S. most-favored-nation tariff rate to carry out tariff reductions provided for in those agreements. This authority was renewed for varying periods of time, with varying conditions attached. In the postwar period, the duration of U.S. tariff proclamation authority conferred by the Trade Agreements Act extension legislation became the major factor determining how long negotiations would last in each of the GATT tariff rounds, and the depth of cut authorized became the main limiting factor for the extent of tariff liberalization each tariff round would produce.[18] Finally, Congress replaced the 1934 Act with new tariff-cutting authority for what became the Kennedy Round of trade negotiations—the Trade Expansion Act of 1962. Yet when Kennedy Round negotiators agreed to a code on antidumping measures and the Johnson Administration transmitted the code to Congress, Congress explicitly rejected it. With this painful experience in mind, in 1973 the drafters of the legislation to authorize U.S. participation in the Tokyo Round worked out a new formula for balancing the interests and roles of the two branches: "fast-track" implementation of trade agreements on non-tariff barriers.[19]

Under the fast-track procedure provided for in the 1974 Act,[20] the President could present the Congress with draft legislation changing U.S. laws as necessary and appropriate to implement a non-tariff barrier agreement, and could be certain that the legislation would be reported out of committee and would receive an up-or-down floor vote within a fixed period of time. In legal form, "fast-track" consisted of a special standing rule for certain trade agreements, as an exception to the House and Senate Rules that generally govern voting procedures and floor amendments.[21] In effect, it created a self-imposed restraint on the otherwise broad Constitutional right of Congress to regulate foreign commerce.[22] In return, Congress gained the right to influence the negotiating process through consultation procedures set forth in the 1974 Act[23] and to thoroughly review the agreements, as well as the legislation and the required Statement of Administrative Action[24]

[17] P.L. 73–316.

[18] Hawkins and Norwood, *supra* note 7, at 104–114; J. Leddy and J. Norwood, *The Escape Clause and Peril Points under the Trade Agreements Program*, in Kelly, *supra* note 7, at 145–146.

[19] "Fast-track" was invented to handle agreements that dealt with non-tariff barriers and would therefore require changes in U.S. law for their implementation; tariff cuts continued to be provided for by delegating to the President the authority to enter into tariff agreements and implement them by proclaiming tariff changes.

[20] Sections 151–152 of the Trade Act of 1974, 19 U.S.C. 2191–2192.

[21] For this reason, "fast-track" could be granted or denied solely by a vote of either House and such a decision would not be subject to Presidential veto.

[22] Some critics mistakenly argue that fast-track procedures deprived Congress of the right to amend legislation implementing a GATT/WTO agreement. This is far from true. In the two major enactments implementing the Tokyo Round and Uruguay Round agreements, numerous Congressional committees spent up to nine months in negotiations with the Administration to agree upon a vast array of amendments that the President would include in the final introduced bill. However, the amendments were made prior to introduction of the legislation, rather than after introduction as is normally the case.

[23] Section 161 of the Trade Act of 1974 (19 U.S.C. 2211).

[24] The "fast-track" procedures required submission of a definitive Statement of Administrative Action describing any administrative action proposed to implement the agreement, and a description of how such action would affect existing law.

before they were introduced. In 1979, at the close of the Tokyo Round, the Administration and Congressional staff worked together on drafting the implementing bill and determining what administrative action would be taken to implement the agreements. The same process would take place in 1994 after the Uruguay Round.

"Fast-track" greatly enhanced the Administration's ability to negotiate beyond tariffs and to make stable promises that the President could secure Congressional approval of the necessary changes in U.S. law, avoiding endless rounds of Congressionally-demanded renegotiation of deals made in Geneva. "Fast-track" became an indispensable element of U.S. participation in GATT/WTO negotiations, and since 1974 no major GATT/WTO round has moved far unless the U.S. Administration has gained fast-track authority. Yet fast-track (now relabeled as "trade promotion authority") has itself become a source of great controversy. Although the Bush Administration was successful in gaining trade promotion authority in 2002, the mounting opposition and the thin margin (214–215) by which it passed in the House of Representatives are harbingers of difficulties to come.[25]

C. The Debate over Multilateralism

The mainstream of the U.S. business community has for many years accepted the need for reciprocal reduction of barriers with our major trading partners. Yet since the debate over the ITO, some in the business community and outside have questioned whether the GATT/WTO system will effectively advance U.S. interests, arguing that the United States should use its size and commercial leverage to insist on better rules or to ensure greater fairness. They have argued that the system as it exists legitimizes foreign unfair practices while preventing U.S. use of reciprocal market access as leverage: they see the most-favored-nation ("MFN") clause as a "lowest-common denominator" approach that simply invites protectionist free riders abroad.

Supporters of trade see multilateral rules as the best way to ensure more open markets for America's highly competitive multinationals and agricultural producers. They argue that the United States, producing and exporting a diversity of products to many markets, is by far the largest beneficiary of a multilateral system. They point to the impracticability of a strict reciprocity policy, the resistance it would bring abroad, and the collateral damage it would inflict on unrelated commercial and foreign policy interests of the United States. They appeal instead to the virtues of reforming the system and exercising leadership, virtues which did have a measurable positive effect for the United States in the Uruguay Round negotiations.

While this debate has never been fully resolved, the basic compromise between these competing views is embedded in many U.S. laws. On the one hand, these laws (and Congress) presume continued participation in the benefits of membership in the GATT/WTO regime: on the other, they seek to condition access to the U.S. market on reciprocal access to markets abroad, or on a foreign government's non-use of unfair practices. Congress expresses statutorily its concerns about unfairness and lack of access to markets abroad–for instance, through Section 301 of the Trade Act of 1974[26] and the various enhancements to it in 1984, 1988 and 1994, granting the President sweeping powers to address "unreasonable" and "unjustifiable" foreign trade practices including

[25] I.M. Destler, *Executive-Congressional Collaboration for Trade Liberalization, OR Games Legislators Play*, paper for Tulane Univ. volume on the Political Economy of Trade Policy Reform (2002), at 1, 18.
[26] 19 U.S.C. 2411 *et seq.*

denial of reciprocal market access, and authorizing retaliation against countries that fail to remove such barriers. But in the end, Congress delegates the responsibility for taking action to the President.

Some groups in the United States—principally import-competing industry and labor—have consistently opposed trade liberalization. Since the early 1990s, they have been joined by anti-globalization NGOs, who may oppose trade and economic growth as anti-environment or as harming workers' rights, or may oppose foreign rules that would bar denial of market access as leverage to influence the actions of foreign governments on environmental or labor issues. This grouping of interests reached their peak in public effectiveness at the time of the disastrous 1999 WTO Ministerial in Seattle. Although that ministerial failed for a variety of reasons,[27] the media perception created was that global protests against free trade were a major contributor to its failure.

Anti-globalization sentiment has markedly declined from its late-1990s peak. In 2000, Congress voted overwhelmingly not to withdraw from the WTO, and more recently the opposition to globalization has been displaced by public security concerns in the wake of the September 11, 2001 attacks. But the future debate will be far more complex. New agreements to expand or strengthen trade disciplines will be far more difficult, and in the years to come supporters of the WTO must not only prevail against the traditional opponents of trade liberalization, but must also convince skeptical elements of American society that it draws the right balance between economic interests and other societal concerns.

D. USTR: The Key Player in U.S. Trade Policy

As discussed above, the relationship between Congress and the Administration is critical to the successful functioning of U.S. trade policy. For the first fifteen years of the GATT, the Administration's principal spokesman on GATT matters was the State Department. This was a constant source of discord with U.S. industry groups and with their supporters in Congress, due to the persistent belief (based on experience) that the Secretary of State would generally put foreign policy interests ahead of commercial concerns. U.S. efforts to revive the economies of Western Europe and Japan, which in another era might have been motivated by long-run economic interests, took place instead as part of a general East-West struggle in which U.S. producers and exporters saw their own trade concerns as taking second place to alliance diplomacy. The Dillon Round negotiations of 1960–62 were the last straw: the European Economic Community (whose formation had been backed by the United States as a bulwark against communism) succeeded in liquidating its members' agricultural tariff concessions, instituting variable levies, and eliminating U.S. access to agricultural export markets in Western Europe. In 1962, when the Kennedy Administration sought legislation authorizing participation in a new GATT round, it became clear that the negotiator would have to be some other entity, an honest broker for trade policy to be housed somewhere else in the Administration.[28]

That legislation, the Trade Expansion Act of 1962, created a special office in the Executive Office of the President, initially called the Special Representative for Trade

[27] *See*, *e.g.*, the discussion in John Odell, *The Seattle Impasse and its Implications for the World Trade Organization*, in THE POLITICAL ECONOMY OF INTERNATIONAL TRADE LAW: ESSAYS IN HONOR OF ROBERT E. HUDEC (D. Kennedy and J. Southwick eds. 2002) (also available at http://www-rcf.usc.edu/~odell/pub.html).

Negotiations and later renamed the United States Trade Representative (USTR).[29] Over time, the USTR would become both the President's chief trade negotiator—both for GATT/WTO matters and for bilateral or regional trade agreements—and the coordinator of trade policy matters within the Administration. Later legislation has progressively enhanced the USTR's authority and role.[30]

In order to ensure adequate private sector input into trade negotiations and trade policy matters, Congress established a system of private sector advisory committees to advise USTR.[31] The principal committee is known as the Advisory Committee for Trade Policy and Negotiations ("ACTPN"), and contains representatives from industry, agriculture, trade unions, environmental and consumer groups, and other interests. A system of sectoral and technical groups below the ACTPN, representing agricultural commodity sectors, industrial sectors, and cross-cutting topical areas such as investment and intellectual property, offers more detailed advice to trade negotiators on specific matters.[32]

IV. The United States in the GATT: Through the End of the Tokyo Round (1947–1979)

A. The Early Years

As noted above, the United States was a leading participant in the seven rounds of GATT negotiations that preceded the Uruguay Round. Indeed, the level of ambition and scope of tariff cuts in these rounds were heavily dependent on the degree of authority granted by Congress to the President to cut U.S. tariffs. In the earliest rounds, U.S. tariff cuts provided the biggest contribution to actual liberalization, because almost all other governments still controlled imports through the use of balance-of-payments restrictions, and under such circumstances, tariff cuts were of little immediate significance.[33] The United States dramatically reduced and bound a large number of tariffs in the first five rounds between 1947 and 1963. Average tariffs on dutiable U.S. imports were cut by forty percent—from 19.3 percent to 11.5 percent—during this period.[34]

The early years of the GATT also saw the first use of the GATT's dispute settlement provisions, and their evolution into a functioning but imperfect system of "diplomat's jurisprudence," as chronicled in Robert Hudec's classic account *The GATT Legal System and World Trade Diplomacy.* The United States was both a user and a target of dispute settlement in these years. U.S. import restrictions on dairy products, enacted in 1950

over Administration objections, became the subject of the one and only case in which the GATT (with the passive cooperation of U.S. trade negotiators) authorized trade retaliation against a contracting party.[35]

The less-than-perfect compliance of GATT members with the rules became particularly apparent in two sectors: agriculture and textiles. Agricultural producers, protected since the interwar period, secured continued protection postwar through import restrictions in both Europe and the United States. In 1955, the GATT authorized a waiver for U.S. use of import restrictions and import taxes to support the two-price agricultural policy of Section 22 of the Agricultural Adjustment Act, which maintained high domestic prices behind import barriers.[36] On the same day, the GATT authorized waivers for "hard-core" agricultural import restrictions in Europe.[37] Illicit import restrictions and other agricultural protectionism in developed countries became a chronic complaint of the developing country members of GATT.

The next sector to become a zone of departure from GATT rules was textiles and clothing. In 1960, the GATT adopted a decision and report recognizing the existence of a problem described as "market disruption," caused by surges of low-cost imports from particular countries. The decision suggested the "problem" could be addressed by bilateral negotiations outside the GATT, supervised by a GATT body.[38] In 1960, presidential candidate John F. Kennedy promised to take action to control textile imports from the Far East, and after the election, the Kennedy Administration pursued negotiations in the textile sector that led to the Long Term Arrangement on Cotton Textiles.[39] In the wake of similar promises by presidential candidate Nixon in 1968, and difficult negotiations with Japan, U.S. negotiators secured an agreement with Japan broadening restrictions to cover synthetic fibers as well; the U.S.-Japan agreement was then multilateralized as the Multi-Fibre Arrangement in 1974.[40] Under this agreement the United States, the EC, Canada and a few other developed countries would eventually negotiate entire systems of bilateral textile quotas, gaining export restrictions in exchange for quota rents and steady quota growth.

B. The Kennedy Round

By the mid-1960s, the world was changing rapidly and new competitors were emerging on the global scene. The European Economic Community had emerged as a new power and formidable negotiating partner in GATT. Japan was becoming a major exporter, moving up the value chain from textiles to steel, autos and electronics. Some developing countries were also beginning to emerge in global markets and to press their agenda in the GATT and other world economic fora. American economic dominance was giving way to a more complex world economy.

In the Kennedy Round, the United States began seeking more meaningful tariff reductions from these partners and also pursued other improvements in GATT rules. Recent events had ensured that the major target for U.S. tariff bargaining would be the EEC. The EEC's common external tariff had been formed in 1960–62 on the basis of an arithmetic average of the bound tariffs of the constituent territories, with imports from the colonies and ex-colonies being accorded duty-free entry. As a result, some former low-tariff markets in Europe were closed to imports by tariff increases and variable levies, and exports to Europe from the United States, Latin America and the Commonwealth were displaced by duty-free products from the colonies.[41] The United States had lost important markets for products such as poultry—triggering the "chicken war" of 1962; in return for the loss of valuable concessions on grains, the only recompense gained was a duty-free binding on soybeans, which the EC did not produce.[42] Soybeans would eventually grow to be the largest U.S. agricultural export to Europe.

To gain tariff cuts abroad, the Administration sought and received authority in the Trade Expansion Act to cut U.S. tariffs by up to fifty percent from then-existing levels.[43] A year later, at a Ministerial meeting held in May 1963, the GATT agreed to an action program for trade liberalization benefiting developing country exports, as well as tariff negotiations on all products, including agricultural products. The tariff negotiations would be based on a plan of substantial linear tariff reductions with a bare minimum of exceptions; the trade round would also include, for the first time, not just tariffs but also non-tariff barriers. Also for the first time, Ministers formally stated that developing countries would not be expected to provide reciprocal benefits in return for concessions benefiting them.[44]

The Kennedy Round negotiations concluded in 1967. Formula tariff-cutting on industrial products succeeded in broadening the scope of reductions; the United States cut tariffs on 64 percent of total dutiable imports. The countries participating in linear tariff-cutting made a weighted average cut of 35 percent on dutiable non-agricultural items, with some exceptions in import-sensitive product sectors. After much struggle, the negotiations produced results in agriculture that were deemed passable, but only because initial expectations were so low.[45] Developing country participants offered up few cuts, and for the most part their tariffs remained unbound. The non-tariff barrier negotiations resulted in discussion for the first time of trade issues relating to procurement, customs valuation, standards, *de facto* tax discrimination against imports, illegal quantitative restrictions and antidumping.[46] They produced an international antidumping code, and a second agreement rolling together elimination of the U.S. "American Selling Price" rules for customs valuation of certain products, tariff cuts on chemicals and other products, and

[46] *Id.* at 256–262.

elimination of European tax discrimination against large cars.[47] Congress reacted negatively to both, and passed legislation explicitly barring domestic implementation of the antidumping agreement.[48] As discussed in Part IIIB above, this led to the development of the "fast-track" procedures governing trade agreement legislation.

C. The Tokyo Round

No sooner was the ink dry on the Kennedy Round than trade negotiators began planning for the launch of a new round. New negotiations would allow them to argue, against Congressional pressure for trade restrictions, that import barriers would undercut U.S. hopes of lowering barriers abroad. The argument was based on the "bicycle theory", that the trade system, like a bicycle, needed to constantly move forward or it would fall over.[49] And in the post-1967 period the risk of falling was substantial. The GATT failed to agree on a new round in February 1970, adopting a preparatory work program instead.[50] Later that year, the House passed overwhelmingly a bill sponsored by Ways and Means chairman Wilbur Mills, calling for quotas on many imports. Meanwhile, in 1971–72, organized labor went all out for the Burke-Hartke bill, which would have imposed quotas on imports and punished U.S. companies that invested abroad.[51] Then in August 1971, the Nixon Administration, under pressure and turning toward economic nationalism, announced a new economic policy, suspended convertibility of the dollar into gold, and imposed a ten percent temporary import surcharge, throwing the rest of the GATT into a spin.[52] The negotiations that followed the surcharge led to agreements with major trading partners on revaluation of their currencies and other measures, including launch of a new round of trade negotiations.[53]

Consensus soon materialized for a launch of a new round in 1973.[54] Meanwhile, work had been going forward on study of the possibilities for further liberalization of tariffs and the non-tariff barrier issues that would form a major topic during the Tokyo Round. The Round was then officially launched at a Ministerial meeting in Tokyo in September 1973.[55]

The Tokyo Round launch coincided with politically and economically challenging times. The expansion of the 1950s and 1960s had given way to "stagflation"—sluggish economic growth and high inflation as oil price increases moved downstream, and the high cost of the war in Vietnam further dragged on the U.S. economy. The Vietnam War and Watergate created a sour atmosphere in Washington, which was accompanied by a general belief that the country was faced with declining trade competitiveness and

unfavorable terms of market access abroad. The growing view among politicians and many industry groups was that the United States had "given away, in purely commercial terms, much more than it has gotten in past trade negotiations," that the United States did not need to help support other industrialized countries by expanding imports from them, and that the United States should insist upon stronger trade rules and greater reciprocity from Europe and Japan.[56]

The first year of the Tokyo Round was taken up by the usual skirmishing among the various players and the decline and fall of the Nixon Presidency. In late 1974, after Gerald Ford took office, Congress finally enacted the Trade Act of 1974, which provided the necessary charter for negotiations in the Tokyo Round, set negotiating goals, and renovated trade policymaking, providing "fast-track" authority and the related machinery for consultation and advice in connection with trade agreements. This software for the new round came bundled with a few extra features: a revised, expanded "escape clause" (Section 201 of the Trade Act), procedures in Section 301 to take action against "unfair trade practices" abroad, authorization of duty-free treatment for certain developing country products under the Generalized System of Preferences,[57] some changes to the antidumping and countervailing duty laws from domestic industry's wish list, and special provisions preventing the Administration from extending MFN treatment to imports from the USSR or other East Bloc countries unless such countries provided freedom of emigration.[58]

The final Tokyo Round negotiations did not really get underway until the inauguration of President Carter in 1977. His new trade negotiator, Robert Strauss, undertook a serious effort to reinvigorate the negotiations. The Tokyo Round agenda had reflected the United States' growing disillusionment with the GATT's non-tariff rules. For the first time in GATT history the negotiations were as much about non-tariff measures ("NTMs") as about tariffs. The NTM negotiations covered subsidies and countervailing measures, import licensing rules, customs valuation procedures, government procurement practices and safeguards. The business community viewed these rules as important because they could help create greater certainty in trade–like the customs valuation agreement, which would address one of the major issues for multinationals that ship goods from one affiliate to another. Improving dispute settlement and rule enforcement also emerged as a major U.S. goal.[59]

Finishing the NTM negotiations was not easy. The ambitious U.S. agenda on agricultural subsidies ran up against the EC's Common Agricultural Policy. Negotiations on a code to discipline "safeguards" under GATT Article XIX failed outright due to fundamental differences over whether contracting parties should be able to impose safeguard measures on a non-MFN basis.[60] Nevertheless, after two further years of hard bargaining, negotiators reached agreement on the texts of a series of "codes," agreements disciplining

[56] Ostry, *supra* note 33, at 85, citing C.F. Bergsten, Toward a New International Economic Order: Selected Papers of C. Fred Bergsten, 1972–74 (1975) at 98–99.

[57] Provided for an initial period of ten years by Title V of the Trade Act of 1974, then renewed for ten years in the Trade and Tariff Act of 1984, then successively renewed from time to time in various legislative vehicles, for periods as short as one year.

[58] The "Jackson-Vanik Amendment," incorporated into Title IV of the Trade Act of 1974, requires the President to deny MFN treatment to goods of any country that does not permit freedom of emigration. This legislation was targeted at a Nixon-era U.S.-Soviet trade agreement, but applied to all East Bloc countries with which the United States did not have normal trade relations as of 1974. The definitive source on Title IV is P. Stern, Water's Edge: Domestic Politics and the Making of American Foreign Policy (1979).

[59] S. Ostry, *supra* note 33, at 86.

[60] GATT, The Tokyo Round of Multilateral Trade Negotiations, Report by the Director-General of GATT (April 1979) at 90–95, Supplementary Report (January 1980) at 14–17.

non-tariff measures. In a delicate compromise between the participants (largely developed countries) and leading non-participant developing countries, the codes were legally structured as interpretations (not amendments) of the GATT, providing obligations which would bind, and be enforceable by, only the countries that accepted them. The codes also included dispute settlement provisions that could only be used by parties to the codes.[61]

The most contentious area of negotiations related to subsidies and countervailing measures. The use of subsidies, and their impact on trade, had risen considerably in the recession-hit 1970s, yet GATT disciplines were inadequate. Export subsidies on industrial products were banned under Article XVI:4, but only for the industrialized countries; there was little discipline on domestic subsidies; and the discipline on subsidies used to boost agricultural exports was weak.[62] The increase in subsidies had led to increasing friction from U.S. use of its (pre-GATT) countervailing duty law, which had no injury test on investigations of dutiable products, and was protected by the "grandfather clause" in the GATT Protocol of Provisional Application.[63] After substantive negotiations started in 1977, U.S. subsidies negotiators worked with the EC, Canada and Japan to evolve a draft outline of an agreement for the 1978 Bonn summit.[64] After further developing the text, they then used the leverage of countervailing duty investigations to persuade Brazil to support the text.[65] The final compromise widened the ban on industrial export subsidies to include minerals, but largely exempted developing countries. It left the agricultural subsidy rules virtually untouched. With the major differences on subsidy policy, this was the most that could be achieved. In exchange, the United States agreed to add an injury requirement to its countervailing duty law.[66]

The other NTM codes were also important to the United States. Some were valuable from an export perspective. The import licensing[67] and customs valuation[68] agreements were important to business as a means to reduce trade barriers created by these procedures, and for the most part they reflected existing U.S. practice. The standards agreement[69]

[61] *See Action by the CONTRACTING PARTIES on the Multilateral Trade Negotiations*, Decision of November 28, 1979, GATT BISD 26S/201, the legal instrument that captured this compromise.

[62] GATT Article XVI:3 provided merely that contracting parties "should seek to avoid" export subsidies on primary products, and that subsidies that operate to increase exports of an agricultural product shall not be applied them in a manner that results in the subsidizing contracting party taking "more than an equitable share of world export trade in that product." *See* Chapter 6 of this book. The negotiation of these obligations in 1946–48 and 1954–55 was heavily influenced by U.S. defense of New Deal "two price" agricultural policies based on restricting imports and subsidizing exports. [66] GATT Report, *supra* note 60, at 57–61. Under U.S. law (section 701 of the Tariff Act of 1930), the executive branch denied the injury test to any country that had not joined the Subsidies Code or had not made a voluntary commitment to limit its export subsidies–in an attempt to avoid the free rider problem posed by the Tokyo Round codes. In 1980, India challenged the legality of this denial under the GATT's most-favored-nation clause through a GATT complaint against the United States, but both parties eventually ducked a confrontation and reached a negotiated settlement. *See Panel on United States Countervailing Duties*, BISD 28S/113 (1981).

similarly was an effort by the United States to export its notions of transparency and fairness to other countries.

Tariff bargaining was also a major theme of the Tokyo Round. In 1977, the EC and the United States agreed to use the "Swiss formula" in formulating their tariff offers, a formula which would make deeper cuts on higher tariffs. The United States presented an ambitious initial offer, to put pressure on its bargaining partners and to take the political heat for liberalization early in the negotiations. But the U.S. offer left out, or made shallower cuts on, high-tariff, import-sensitive products of interest to the EC, such as textiles, chemicals and ceramics.[70] In final bargaining early in 1979, both sides took some offers off the table and closed out the industrial tariff negotiation with an average cut of about 35 percent on each other's trade. The number of U.S. tariff headings subject to duties over twenty percent dropped from 757 to 185.[71] These tariff peaks would remain as targets in the Uruguay Round. For the first time, developing countries participated in tariff negotiations, though only 21 made tariff cuts at all.[72]

The Administration had been consulting with private sector advisory committees and with Congress throughout the negotiations; it notified Congress on January 4, 1979 of its intent to submit the agreements for approval under the fast-track authority granted in the 1974 Trade Act. Through industry briefings, closed-door hearings before Congressional committees, intensive consultations, and legislative drafting, Ambassador Strauss's team dealt with the concerns of all relevant domestic players. In only one case was it necessary for USTR to reopen negotiations in Geneva to meet a Congressional need.[73]

The fast-track provisions of the Trade Act called for the Administration to submit legislation "necessary or appropriate" to implement the Tokyo Round agreements, together with authoritative "statements of administrative action" explaining non-statutory changes (such as regulatory changes) that would be made. The implementing bill submitted on June 19, 1979 included not just "necessary" changes—such as the institution of an injury test for countervailing duty investigations of dutiable products—but also a wholesale remodeling of the U.S. antidumping and countervailing duty laws. The changes shortened deadlines, strengthened preliminary relief, made determinations more automatic, strengthened domestic industry's right to seek judicial review of determinations, and defined injury in a way that blunted the potential impact of the injury test as agreed to in Geneva. The bill, entitled the Trade Agreements Act of 1979, passed the House by 395 to 7, and the Senate by 90 to 4.[74] In connection with its passage, the Carter Administration reorganized trade policymaking, further strengthening USTR and moving antidumping and countervailing investigations from Treasury to the Commerce Department, in response to domestic industry concerns that Treasury had leaned towards import interests.

Eventually, the Tokyo Round results became a victim of the way they had been sold to the public. The boring, low-key negotiations that had received the least press play—on tariffs, and on the new agreement on customs valuation, for instance—proved to be a

[72] *Id.* at 272.

[73] In the Agreement on Government Procurement ("Procurement Code"), the U.S. offer for code coverage did not carve out set-asides for government contracting with minority and small businesses. After a difficult hearing in Congress, Ambassador Strauss instructed his negotiator to return to Geneva and fix the problem. An exception was inserted in the U.S. offer; the price was inclusion of the National Aeronautics and Space Administration in the Procurement Code.

[74] G. Winham, *supra* note 53, at 308.

gift that kept on giving. The highest-profile negotiation, on subsidies, raised exporters' expectations unrealistically and in the end produced few results of immediate commercial utility. Disillusioned U.S. industry and agricultural groups blamed the "à la carte" approach of codes that bound only participants. Instead of focusing on the fact that the codes covered almost all industrialized countries and most of world trade, they focused on the lower level of obligations taken on by developing countries, particularly those in Asia. Agricultural exporters remained unhappy about the lack of discipline on agricultural export subsidies. The weakness of GATT dispute settlement and its failure to ensure rule compliance (by others) were also a focus of chronic discontent.

V. The 1980s: Congressional Unrest, Bilateralism and a Globalizing Economy

The next decade of trade policy debate would be dominated by two major movements, both of which challenged the relationship between the United States and the institutions of the multilateral trading regime. The dance between Congress and the executive branch continued as always, but the tempo accelerated and the music became louder. Pushed by capital inflows and the U.S. budget deficit, the dollar strengthened from 1981 to 1985, leaving in its wake an ever-growing U.S. trade deficit, job losses, and ever-increasing political pressure on trade issues. The political pressure led to increased protection through revision of the trade laws and industry-specific intervention to restrain trade. It also led export-minded members of Congress to blame the deficit on closed markets abroad, and to push for a more unilateral trade policy featuring aggressive use of Section 301. Secondly, in a historic break with U.S. MFN-based trade policy, the Reagan Administration launched the first U.S. free trade area with Israel, to be followed by the U.S.-Canada FTA and, in 1993, the NAFTA. Amid all of this turmoil and weakening support for GATT, however, the Reagan Administration would somehow succeed in launching the Uruguay Round and obtaining Congressional authority to negotiate the Round.

A. The Early 1980s: Trade Deficits, Trade Restrictions, Breakdown in Geneva

In 1981, the newly-elected President Ronald Reagan mobilized his popularity and his electoral mandate to radically change U.S. economic policy by enacting a "supply-side" budget and tax cuts. The resulting fiscal deficit, combined with other factors in the world environment, drove up the dollar; from a low in 1980 to its peak in late February 1985, the dollar rose 70.2 percent on a trade-weighted basis.[75] This misalignment of exchange rates had severe economic and political consequences. The U.S. trade deficit rose to $67 billion in 1983, $114 billion in 1984 and $124 billion in 1985.[76] Global trade stagnated, U.S. exports were level or declining, but imports exploded: by 1985, U.S. imports were 158 percent of the value of U.S. exports.[77]

Major and minor industries campaigned for import relief. In 1981, under pressure from auto industry problems and Congressional proposals to legislate import quotas, the Reagan Administration negotiated a voluntary restraint on Japan's exports of automobiles. In 1982, the steel industry used the trade law provisions revised in 1979 to bring a

[77] *Id.* at 170.

massive group of countervailing duty and antidumping petitions against European suppliers, resulting in another voluntary restraint limiting European carbon steel exports to the United States. A later petition under Section 301 led to a restraint by Japan. In 1984, the steel industry brought a new wave of cases against Brazil, Mexico and Korea. Finally, in response to a 1984 safeguard petition under Section 201 of the Trade Act of 1974, the USITC found injury and recommended relief; in response, President Reagan announced a negotiating program to limit steel imports to 18½ percent of the U.S. market.[78] As of 1985, over one-quarter of U.S. manufactured imports were of products subject to significant quantitative restraint.[79]

At the same time, members of Congress, with the support of the business community, began to push for a more muscular, "results-oriented" trade policy, targeted at "prying open" closed export markets in countries abroad. In early 1982, Senator John Danforth of Missouri introduced a bill modifying Section 301 to authorize denial of market access to products of those countries denying reciprocal market access. Japan was the principal target, as it was the principal target of initiatives by the Ways and Means Committee fighting "industrial targeting." The pressure would continue to escalate through the middle 1980s.

The Reagan Administration's capable USTR, William Brock, fought trade restrictions and tried to deal with the pressures by working hard to start a new round of trade negotiations. He succeeded in getting the GATT to hold its November 1982 annual meeting at the Ministerial level, but the meeting took place in an atmosphere of crisis and produced disappointing results. Still, the near-failure of the 1982 Ministerial convinced many governments that some new initiative was necessary and the trading system could not be left to drift. The 1982 Ministerial Declaration also required the GATT to start work on agriculture, services, trade in counterfeit goods, and other new and old areas. This work proved critical in establishing the knowledge base necessary before governments could agree to include these subjects in a round of multilateral trade negotiations.[80] The agriculture work program set the parameters for later work in the Uruguay Round, and was the springboard for analytical work by OECD economists on measuring and making visible the high cost of agricultural protection.

The Reagan Administration's foreign policy then provided the opening for the first U.S. ventures into bilateral and unilateral trade preferences. The first step was the Caribbean Basin Initiative ("CBI"), proposed by President Reagan in February 1982 and enacted in mid-1983. The CBI provided unilateral duty-free treatment to non-Communist countries in the Caribbean certified as complying with a list of conditions.[81] Next came Israel.

[80] J. Croome, Reshaping the World Trading System: A history of the Uruguay Round (1995), at 14–16. Ministerial Declaration adopted Nov. 29, 1982, BISD 29S/9. This was the first multilateral endorsement of services as a negotiating topic in the GATT. On the November 1982 Ministerial, *see* Dryden, *supra* note 28, at 283–287.

[81] The conditions bar CBI treatment for any country that has nationalized or expropriated U.S. property without compensation; fails to recognize arbitral awards in favor of U.S. citizens; affords preferential treatment to products of other countries that has a significant adverse effect on U.S. exports; broadcasts U.S. copyrighted material without the owner's consent; has not signed an extradition treaty with the United States; and has not provided (or is not taking steps to provide) internationally recognized rights to workers. These conditions resemble those which applied to U.S. GSP treatment after 1984. The President must also take a number of other factors into account in deciding whether to designate a country for CBI treatment, including its compliance with GATT rules; U.S. access to its market and to its commodity resources; its export subsidies or export performance requirements; whether it provides adequate means for foreign nationals to secure

Israel had proposed negotiation of a free trade area ("FTA") with the United States in 1981. In November 1983, the two countries announced they would negotiate an FTA. Legislation authorizing negotiations with Israel and Canada passed Congress in 1984, and the FTA was negotiated with Israel, approved by Congress and entered into force in 1985.[82] In 1985, U.S. and like-minded negotiators again tried and failed to launch a new round in Geneva. Negotiations with Canada then were launched in December 1985 and were concluded on October 3, 1987. Then, as now, bilateral free trade proved attractive to the business community and to U.S. trade negotiators. For some kinds of business (for instance, services in the Canada-US FTA), FTAs could produce market access unattainable through GATT. For U.S. trade negotiators, FTAs offered both leverage to get better results from GATT trading partners, and a place to innovate in trade liberalization.[83]

B. Congress Grows Restless, the Administration Responds, and a New Round Begins

As the trade deficit continued to mount in 1984–85, pressures for trade restraints grew, and so did discontent with the Administration's failure to take action on the dollar. Over six hundred trade bills were introduced in Congress, 99 of which were directly protectionist.[84] The bills echoed two basic themes: the U.S. economy was the most open in the world, and Reagan Administration trade policy, by giving precedence to foreign policy concerns, was failing to look out for the U.S. national economic interest in fighting unfair trade barriers abroad.[85] The rhetoric escalated into a Senate resolution approved 92–0 in March 1985, denouncing Japan and calling on the President to retaliate against Japanese imports.[86] The Senate Finance Committee then approved a bill making retaliation under Section 301 mandatory.[87] Congressman Dick Gephardt, joined by the chairmen of the House and Senate trade committees, cosponsored a bill calling any country with a high and persistent bilateral trade surplus (Japan, Brazil, Korea, Taiwan) to reduce its surplus or face a 25 percent tariff surcharge. A bill mandating restrictive global quotas on textiles, intended as leverage for the negotiations on renewal of the Multi-Fiber Agreement, passed by 262–159 and was vetoed, and a veto override failed by just eight votes.[88] All of these measures would clearly have violated GATT. The lopsided votes should not be interpreted as a sudden lurch by Congress into the unthinkable, but as Congress sending an unmistakable message to the President. Because the Reagan Administration had made it clear in advance that legislation violating GATT would be vetoed, these votes provided a cost-free opportunity for legislators to express frustrations with foreign trade surplus countries, without any difficult real-world consequences.

The pressure from Congress (with the support of the business community) only lessened when the Administration took action. On September 7, 1985, President

and enforce intellectual property rights; and its self-help efforts. *Caribbean Basin Economic Recovery Act* (CBERA), P.L. 98–67, 19 USC 2701 *et seq*., Section 212.

Reagan announced that the Administration would open three new Section 301 cases against Japan, Korea and Brazil, and that the United States would retaliate unless two past GATT cases were settled by December 1. A day later, he announced a massive war chest for export credits and a USTR strike force on trade barriers, stating that "free trade is, by definition, fair trade."[89] Then, on September 22, 1985, Treasury Secretary James Baker and four other finance ministers announced the "Plaza Agreement," declaring their cooperation in an orderly appreciation of non-dollar currencies.[90] Later that fall, the United States self-initiated an antidumping investigation of semiconductors from Japan, a key move in the chain of events that led to a July 30, 1986, bilateral agreement with Japan on measures to expand Japanese imports of semiconductors.[91]

Meanwhile, on the multilateral front, USTR Brock and his negotiators had kept pushing for a new round of negotiations, working in the Quad (the group consisting of the EC, the United States, Japan and Canada) and then building out to a larger group of trade ministers in 1983–84. In April 1985, OECD trade ministers agreed to propose the launch of a new round; Brock became the Secretary of Labor and was replaced by Clayton Yeutter, a veteran trade negotiator who had been Deputy STR in the mid-1970s. In Geneva, developing countries led by India and Brazil continued to resist a new round, arguing that existing trade restrictions had to be reformed first and that any round should be confined to trade in goods, excluding services trade. After the GATT Council was unable to reach consensus for or against a round in July 1985, the United States, believing that the majority of the GATT wanted to launch a new round, called for a special meeting of the CONTRACTING PARTIES.[92] A month later, the necessary votes had been mobilized to call the special meeting, held at the end of September, shortly after the Reagan Administration's announcement of its new trade policy.[93] A Preparatory Committee ("Prepcom") was set up in November to prepare for a meeting of ministers in September 1986. The Prepcom became the formal forum for debate on the subjects that would be negotiated. At this time, the United States first proposed changing the focus of negotiations on trade in counterfeit goods to embrace as well substantive standards for protection of intellectual property, and sold this approach to industrialized countries.[94]

After the Prepcom reached deadlock, an informal parallel process sprang up, leading to the key breakthrough that made it possible to launch the Uruguay Round with the agenda that would lead to the WTO Agreement of today. As Ernest Preeg describes, U.S., EC and Japanese negotiators stood back as smaller industrial countries joined with supporter developing countries. The large countries then rejoined this Group of 48, chaired by Switzerland and Colombia. By early August, the "G-48" had produced a draft declaration for the September Ministerial. The "G-10" led by Brazil and India

[92] Account from J. Croome, *supra* note 80, at 23–26.

[93] As John Croome, the Secretariat's historian, recounts, under GATT rules, "the GATT contracting parties could by simple majority 'decide to conduct, sponsor or support multilateral negotiations,' although they could not oblige individual countries to accept new substantive obligations as a result of such negotiations." After the 1985 vote showed the extent of support for a new round, the countries that opposed the round never demanded a vote, and Uruguay Round decisions were made by consensus. *Id.* at 26.

[94] E. Preeg, Traders in a Brave New World: The Uruguay Round and the Future of the International Trading System (1995), at 56, citing GATT doc. Prep.Com(86) SR/3, April 1986, at 10.

then produced their own draft, setting the scene for the Ministerial Meeting. Agricultural exporting countries also formed their own caucus to push for agricultural negotiations, the Cairns Group.[95]

During the last night of negotiations at the meeting in Punta del Este, Uruguay, first the United States and the EC resolved their differences over agriculture, then Yeutter accepted an EC compromise proposal for dual-track negotiations on services and goods. Yeutter then insisted on inclusion of TRIMs in the mandate and Commerce Secretary Malcolm Baldrige obtained agreement to include intellectual property rights protection.[96] With the resulting Ministerial Declaration on the Uruguay Round—universally referred to as the "Punta del Este Declaration"—years of work by U.S. negotiators had finally reached the goal of launching a comprehensive trade round. To actually negotiate, however, Yeutter would need legislation providing fast-track negotiating authority or something like it.

C. The Omnibus Trade Act of 1988

Despite the Reagan Administration's attempt at a more assertive trade policy, tensions with the Democratic Congress continued to rise. The Democratic leadership in the House of Representatives decided in 1986 to enact an omnibus trade bill as showcase legislation with contributions from many committees. The bill would include a renewal of fast-track authority for the new round, a "must-have" to which Congress could attach initiatives less palatable to the Administration. The 1986 version of the trade bill pulled in the "Gephardt Bill" punishing trade surplus countries, proposals on foreign industrial targeting, proposals to tie U.S. trade policy to industrial policy, items from the steel industry's antidumping wish list, sectoral market access provisions in telecom and intellectual property, and other ideas that had been percolating for years. The Ways and Means Committee attacked the Administration as showing "slavish devotion to rules of the GATT which few of our trading partners take as seriously," and pointed to a

> "basic dilemma confronting us in international trade: our competitiveness is being undermined by policies and practices which the rules of GATT and other agreements do not adequately discipline. The United States must play a leadership role in revising and strengthening international trade rules . . . Today, however, we must demonstrate to our trading partners that we will protect our national economic interests until such discipline exists."[97]

In November 1986, the Democrats retook the Senate majority, and in January 1987 the Democratic leadership resubmitted the 1986 trade bill.[98] The bill started in the House and quickly gathered steam, picking up provisions from the Ways and Means and other committees. In a pitched battle on April 27 between labor and business interests during House floor consideration, Gephardt succeeded by a vote of 216–214 in having his original trade surplus proposal attached to the bill, the day before a visit by Japanese Prime Minister Nakasone.[99] Meanwhile, the Senate developed its own trade bill. The

[98] H.R.3, 100th Cong. 1st sess.

[99] Preeg, *supra* note 94, at 68; J. Bello and A. Holmer, *The Heart of the 1988 Trade Act: A Legislative History of the Amendments to Section 301*, in AGGRESSIVE UNILATERALISM: AMERICA'S TRADE POLICY AND THE WORLD TRADING SYSTEM (J. Bhagwati and H. Patrick eds. 1990), at 79.

Senate Finance Committee took a different approach to the "surplus country" problem, revamping Section 301 and mandating retaliation in some cases.[100] Then, during the month of floor debate on the bill, the Senate attached a new proposal to the bill, a compromise between the Gephardt and Senate Finance proposals: the systematization of Section 301 that became known as "Super 301."

The conference between representatives of the House and Senate to reconcile the bills started in August 1987 with offers and counteroffers on the easy provisions, went into hibernation with the October 1987 stock market crash, and started up again in February 1988. Intense horse-trading resolved the last provisions of the bill on March 31, as the conferees agreed to drop the Gephardt Amendment, to include Super 301 on a temporary basis, and to moderate the changes to Section 301. The President then vetoed the final bill on May 24 because the conferees had included provisions requiring advance notice for plant closings; after a veto override failed, the trade bill and the plant-closing provisions were reintroduced separately, and each passed again by veto-proof margins. The President signed and enacted the trade bill into law on August 23, 1988.[101]

The Omnibus Trade and Competitiveness Act of 1988 was a grab bag of provisions, including the all-important negotiating mandate for the Uruguay Round, and Super 301 and other provisions that would have unpredicted effects on the negotiating climate. It provided proclamation authority for tariff agreements, and fast-track approval procedures for any trade agreements, entered into before June 1, 1991, if the President notified Congress of his intentions ninety days in advance. As a fallback, the President could seek a two-year extension to 1993 by March 1, 1991, by submitting a request to Congress describing progress and stating why the extension was needed. The extension would then be granted unless vetoed by resolution by either the House of Representatives or the Senate.[102]

The Act ordained ambitious negotiating objectives. The overall goals were to obtain more open, equitable, and reciprocal market access, reduction or elimination of trade barriers, and a more effective system of trade disciplines and procedures.[103] The Act also mandated detailed "principal trade negotiating objectives" in sixteen areas, starting with dispute settlement,[104] institutional expansion of the GATT to new areas of trade,[105] and securing more benefits from developing countries.[106] The trade-surplus concerns of the high-dollar period were reflected in provisions asking negotiators to develop rules requiring countries with "large and persistent current account imbalances" to change their policies to achieve equilibrium, calling for greater trade and monetary coordination, and asking negotiators to reduce barriers to access to foreign high technology and obtain reciprocal market access by resolving identified bilateral trade barriers.[107] The Act also

[107] *Id*. §1101(b)(5), (6), (15) (19 USC 2901(b) (5), (6), (15)).

provided detailed objectives for the mainstream agenda items of agriculture,[108] intellectual property,[109] services trade,[110] investment,[111] safeguards and unfair trade.[112] A worker rights objective—which U.S. negotiators would pursue doggedly and unsuccessfully—asked negotiators to promote a GATT review of the relationship of worker rights to GATT provisions, and to adopt as a GATT principle that denial of worker rights should not be a means of gaining competitive advantage in trade.[113]

The 1988 Act prompted adverse reactions among most GATT members, and accusations that the United States was abandoning multilateralism. Although the provisions with the biggest symbolic freight, such as the Gephardt Amendment, were dropped in the end, and the revisions to Section 301 left the President with enough discretion in using the statute that he could avoid violating the GATT, Congress had intended many of the provisions in the new law to convey a muscular message of willingness to retaliate. The suspicion in many foreign capitals was that these provisions would herald an increase in unilateral measures and a further departure from reliance on GATT.

D. The Globalizing Economy

As Congress, the Administration and the business community debated what kind of trade policy to have, in those four years between 1984 and 1988, the U.S. economy went through fundamental changes. By 1988, most U.S. companies had gone through major changes, and in many sectors the United States had regained its competitiveness with Europe and Japan. There had been a rebound in the auto industry, but even more impressive was the rapid expansion of the U.S. computer and software sectors, telecommunications, motion pictures and video, recordings and aircraft. U.S. agriculture expanded its foreign markets as well.

But growth in exports and international competitiveness was only part of the story. More importantly, U.S. corporations had become even more globalized, and now viewed the liberalization of the world economy as essential to serving their interests. Fewer and fewer sectors saw pure protectionism as a solution to their needs. Hence, by the time the 1988 Act was completed, American industry was prepared to push hard for trade liberalization. These industries had now become interested in strengthened rules in areas of

[108] *Id.* §1101(b)(7) (19 USC 2901(b)(7)) (developing improved agricultural trade rules including disciplines on trade-distorting import and export practices; increasing U.S. exports by eliminating barriers to trade and reducing or eliminating production subsidies (consistent with U.S. price stabilization policies); "resolving questions" on subsidies, pricing, tariffs, quotas and sanitary and phytosanitary measures; seeking agreements to reduce overproduction of during periods of oversupply).

[109] *Id.* §1101(b)(10) (19 USC 2901(b)(10)) (strengthening foreign intellectual property enforcement, expanding GATT obligations to include adequate substantive requirements to protect intellectual property rights, border enforcement procedures and dispute settlement; strengthening other IP conventions).

particular importance to their success. The pharmaceuticals, film and software industries wanted to see intellectual property protection strengthened. The financial services and accounting industries wanted to see GATT rules extended to services. The forest products, chemicals and agricultural sectors wanted to see major tariff reductions. All of them became interested in seeing the 1988 Act serve as a catalyst for market opening rather than a pretext for protectionism. This was to bode well for the GATT and would ultimately provide the necessary political support to fuel the Uruguay Round negotiations.

VI. The Uruguay Round

A. The Importance of the Round to U.S. Policy

Without question, the most ambitious, far-reaching and unexpected transformation of the GATT system occurred in the Uruguay Round. When the Round began in 1986, it was supposed to conclude in 1990 as a package of add-ons to the GATT. By the time it concluded in 1994, the GATT system had been swept into an entirely new context, the WTO Agreement and the World Trade Organization. This institutional change, of which the United States was only a reluctant supporter, made it possible to achieve almost all of the Uruguay Round objectives set by Congress in the 1988 Act.

As we have seen, improvement of the GATT's effectiveness, strengthening of rules on agriculture, and new disciplines on services trade and intellectual property rights protection were key goals for U.S. negotiators going into the Round. Earlier attempts at expanding GATT disciplines were limited to decisions that all contracting parties could agree to, or to the Tokyo Round codes whose membership was mostly limited to a few industrialized countries. The Punta del Este Declaration, which launched the Uruguay Round, included a commitment that the results of the Round would be a "single undertaking" and also provided for negotiations on the new areas of services, intellectual property and trade-related investment measures ("TRIMs"). Yet the Punta del Este Declaration did not mention any WTO, nor any specific institutional agenda other than improving GATT decision-making.

In the end, the Uruguay Round resulted in a great expansion of multilateral trade disciplines. The WTO Agreement retained the original text of the GATT, tied into a network of other obligations including improved rules on trade in goods, a new General Agreement on Trade in Services ("GATS"), a new Agreement on Trade Related Intellectual Property Rights ("TRIPS"), and new, more binding dispute settlement rules contained in the Understanding on Rules and Procedures Governing the Settlement of Disputes (the Dispute Settlement Understanding, or "DSU"). The agreements on trade in goods provided for tariffication of all agricultural import barriers, multilateral discipline on agricultural and other subsidies, enhanced rules on antidumping, safeguard measures, import licensing, customs valuation and numerous other issues, and a phase-out of the Multifiber Agreement.

The new post-Uruguay Round system also met the U.S. goal of a more unified system with more meaningful participation by all. Because the WTO Agreement included the GATT, and because the United States and other leading trading partners announced their intentions to leave the GATT system behind after joining the WTO, all GATT member countries that wished to retain their rights to GATT treatment in the United States had to join the WTO. In joining the WTO, they accepted all of the obligations of every one of the agreements in the WTO system, with the exception of the four so-called Plurilateral Agreements. The Tokyo Round codes with their limited membership were almost all

absorbed into the WTO, and then terminated. The provisions of the GATT 1947 were incorporated into the WTO Agreement and then the GATT 1947 too was terminated, taking with it the Protocol of Provisional Application. In place of the old patchwork was a universal set of rights and obligations, although members still had different levels of obligation reflected in their tariff and services schedules, and the rules provided special and differential treatment for developing countries and the least-developed countries.

Finally, the Uruguay Round represented the most extensive market access agreement ever negotiated in the GATT system. After the Round, almost all developed country imports would benefit from the legal security of tariff bindings; developed countries reduced and bound tariffs on 64 percent of their trade in industrial products. Agricultural non-tariff barriers were converted to tariffs and all agricultural tariffs of all WTO Members were bound. Developing countries participated significantly in industrial tariff cutting as well, reducing and/or binding tariffs on over half of industrial imports.[114] Add to that the market access commitments in the services sector and minimum access commitments in agriculture, and the overall results in terms of market access were truly impressive.

These remarkable new agreements that emerged from the Uruguay Round are thoroughly explained in other chapters of this book. It is not the purpose of this chapter to discuss the agreements or their negotiation in detail. Rather, the purpose here is to examine the U.S. role in the round and the importance of U.S. positions and interests.

As a point of departure, one cannot help but comment on the extent to which the final Uruguay Round agreement reflected U.S. aspirations and negotiating objectives. Agreements on TRIPS, services and agriculture were the three highest priorities of the United States from the very beginning, and each of the three was only accomplished after overcoming initial skepticism and fierce opposition from various participants. Moreover, from the outset the United States had sought to strengthen discipline on subsidies generally, to create a more binding dispute settlement system, and to increase the level of obligations of developing countries (through, for example, more extensive tariff bindings and new commitments on services). By any measure, therefore, the Uruguay Round agreement was a significant policy victory for those in the United States who advocated a more effective and universally binding set of multilateral rules and disciplines. Of course, the final agreement was viewed with disfavor by import-competing groups, such as the textile industry, unions and other heavily protected interests who viewed with alarm the prospect of greater import competition. In addition, a new coalition of interests, composed of environmental groups and other anti-globalization groups, would combine to oppose this new, more powerful international trade regime.

At this point, we will review the U.S. efforts to bring about this landmark agreement, and some of the major events that helped shape the final package from the perspective of the United States. We then shift to the debate over implementation of the agreement by Congress, to illuminate some of the internal tensions created by the new WTO system.

B. 1986–89: Building the Three Key Pillars

The new round, launched against a backdrop of rising U.S. trade deficits and growing U.S. unpredictability in trade matters, represented an important part of the U.S. negotiators' plan to defuse domestic pressures on them. An active trade round would mobilize

[114] GATT Secretariat, *Increases in Market Access Resulting from the Uruguay Round*, NEWS OF THE URUGUAY ROUND No. 85, April 12, 1994 (highlighting gains made in the Round); *see also* WTO Secretariat Special Studies No. 6, MARKET ACCESS: UNFINISHED BUSINESS, 2001 (highlighting work remaining to be done).

pro-trade forces and make multilateral negotiations a viable alternative to Congressional self-help. Agriculture was a key U.S. interest group as always, and internationally it was clear that agriculture would be *the* key issue for many countries. Market access for goods would also provide a motor propelling the talks forward, and a source of negotiating tradeoffs. But in the United States, support for this round was strongest from domestic groups pushing the "new issues" of services, intellectual property and investment.

The Punta del Este Declaration, which provided the Round's official starting point and charter, was a delicately balanced mix. It called for negotiations in fourteen areas plus trade in services. Issues in the fifteen areas fell into three groups: the complex of issues surrounding agriculture; the "new issues" of services, TRIPS and TRIMs; and market access for goods, including textiles, safeguards, antidumping, and other issues relating to trade in goods. The mixture of issues mirrored the mixture of interests in the United States, the EC and other major players. Yet the major players were fundamentally and deeply divided on each of these issue areas.

Agriculture divided the key actors in the Round from the beginning until the very end. On one side, the United States and the Cairns Group sought to negotiate major reductions in export subsidies, domestic support and import protection. Their arguments were strengthened by the years of work that had taken place in the GATT Committee on Trade in Agriculture on non-tariff trade measures, and the OECD's analytical work measuring the costs of agricultural protection–estimated at $177 billion for 1987 for all of the industrialized countries.[115] On the other, the EC sought to protect its Common Agricultural Policy, which was based upon high internal prices, export subsidies and a variable levy on imports. Japan and Korea wanted to avoid liberalization of their high import barriers on rice, beef and citrus products, and Canada wanted to avoid tariffication of its import barriers on dairy and poultry. Some U.S. commodity groups also opposed negotiations on agriculture, particularly those with high levels of domestic protection. But their influence was more than offset by the much larger grains and specialty crops producers, all of whom were large exporters and were directly affected by EC protection and subsidies.

The U.S. view on agriculture was shaped by many forces in the agricultural sector, but reflected most strongly the free-market views of the Reagan Administration, especially those of Clayton Yeutter. Yeutter was an agricultural economist by training and had been President of the Chicago Mercantile Exchange. His eager insistence on a sweeping agreement to eliminate agricultural export subsidies, and his aggressive use of Section 301 against EC export subsidies at the beginning of his term in 1985 testified to his strong desire to take on the Common Agricultural Policy and recapture American leadership in agriculture trade. External policy developments also made the issues more urgent and strengthened Yeutter's hand. The EC had become a major exporter of grains beginning in 1980, with a sharp upward turn in grain export subsidies. Congress reacted with Export Enhancement Program counter-subsidies, straining the budget and squeezing third country exporters.[116]

Yeutter opened with a radical proposal to eliminate all border restrictions on imports, non-decoupled internal price supports and export supports over ten years. This "Zero 2000" proposal was developed by USTR and USDA, with the enthusiastic support of President Reagan. It produced an equally strong reaction from Europe, which argued (correctly) that the U.S. proposal was intended to end the CAP in its current form.

[115] Preeg, *supra* note 94, at 94.
[116] *Id.* at 94–95.

The Yeutter proposal even went beyond what the Cairns Group considered would be realistic. The high ambitions of the United States were blamed at times for the blockage on agriculture that gave the Uruguay Round its start-and-stop quality in Geneva, of periods of intense activity interspersed with long periods of waiting for movement on agriculture issues so that the Round could get going again. Indeed, after a 1988 package of CAP reforms, there was little or no visible movement by the EC until the Blair House agreement of 1992.[117] But while Yeutter's extreme opening position may have made it more difficult to get to the compromise reflected in the Agreement on Agriculture, it also changed the balance of that compromise, and how much Europe moved from its initial position. Making the stakes higher, it changed the final result.

Almost as fundamental were the differences between developed and developing countries on the "new areas" of services, trade-related intellectual property measures and trade-related investment measures. India and Brazil in particular had opposed inclusion of these subjects in the new round, arguing that they would fundamentally alter the entire GATT system and would not serve developing countries' interests. They viewed these proposed agreements as an effort by the United States and other rich countries to bias international rules in their own favor. They argued that only the rich countries conducted enough research and development to generate patents and trademarks, and that developed countries' service sector businesses would overwhelm their developing country competitors, especially in sectors such as banking or telecommunications.

Of course, India and other developing countries did have an affirmative interest in phasing out the Multifiber Arrangement and achieving freer trade in textile products. Brazil very much wanted to see an agriculture agreement, and many Asian exporters wanted to see a much tighter antidumping code to discipline the use of antidumping measures by the United States and the EC. They also wanted a much more meaningful discipline over so-called "safeguard measures" that included clearer restrictions on the use of informal import or export restraints in place of Article XIX safeguards. These negotiations on rules for trade in goods were all problematic for the United States. Although U.S. negotiators agreed in principle that these areas of protection needed to be reined in, they also knew how difficult it would be to create a winning coalition in the face of opposition from U.S. groups supporting import protection. From the U.S. negotiators' viewpoint, it would be necessary to get very strong agreements in agriculture and the new policy areas, in order to overcome opposition by import-competing industries.

In launching the Uruguay Round, the Ministers at Punta del Este also established the Trade Negotiations Committee, or TNC, the body that would move negotiations forward, and under it two separate groups, the Group of Negotiations on Goods and the Group of Negotiations on Services. Back in Geneva, negotiators established fourteen negotiating groups in goods (one for each of the subjects listed in the Punta del Este Declaration), agreed on negotiating plans based on the Punta del Este text, and set dates for the groups to meet. They also adopted a program for the initial phase of the services negotiations and set up a "surveillance body" to oversee standstill and rollback commitments in the Punta del Este Declaration.[118]

The drama of the launch was over, and the painful slog forward had begun. Each of the groups had to work out its own agenda, gather proposals from all sides, and work first toward consensus on the "modalities" or ground rules of how to negotiate. Serious

[117] *Id.* at 96–97.
[118] *Decisions of 28 January 1987*, BISD 33S/31.

negotiations could only begin when agreement had been reached on modalities, but the key role of the modalities meant that agreement on preliminaries would not be easy to reach. Early in 1987, Clayton Yeutter began to push for another Ministerial Meeting to be held after the 1988 U.S. election. The meeting was billed as a midterm review and "early harvest" of results from the Round, including a framework agreement for services and agricultural trade liberalization, serving two key U.S. constituencies for the Round.[119]

As has been seen, 1987–88 was a difficult period for trade policy, with the U.S. omnibus trade bill, many protectionist proposals, and continuing U.S.-EC friction over agricultural trade. But some small progress emerged in the negotiating groups. In agriculture, for instance, although the grand lines of decision remained largely stuck between the U.S. "zero option" proposal, the Cairns Group proposal and the EC, the group made progress on technical issues such as quantifying and measuring support to agriculture, the tariffication concept advanced by the United States, and work on sanitary/phytosanitary barriers.[120] In the services area, negotiators started by discussing the ways services are traded, how to apply concepts of transparency, national treatment and MFN treatment, sectoral coverage of a services agreement, and barriers to trade in services. Many delegations then tabled proposals for a framework on services in 1988, but they had barely begun to engage on negotiations by the time of the Montreal Ministerial.[121]

Modalities took up the first two years of discussions in the negotiating group on tariffs. The question was how to approach the job of negotiating tariffs: line by line or through some variation on a formula approach. U.S. negotiators were faced with U.S. tariff peaks that protected politically powerful import-sensitive industries such as the textile industry of the South and the glass industry of West Virginia. They dug in and resisted pressure from the EC and others for a formula approach that would have targeted those peaks. By the time of the Montreal Ministerial, the impasse over modalities was resolved in favor of a fallback to overall targets for average tariff reductions, to be made in item-by-item negotiations that would start in 1989.[122]

In the rules area, negotiators quickly moved forward with proposals to address the long-standing topics of safeguards, subsidies, the other Tokyo Round agreements, and ways to improve the GATT rules. U.S. safeguards proposals pursued the adjustment concerns seen in the 1988 Act, as negotiators again tried for agreement on a decision interpreting and applying GATT Article XIX. As the Montreal Ministerial approached, negotiators were split on the key issues in the negotiation: whether safeguards could be selective, and how to ban "grey-area measures" (such as selective voluntary export restraints, or "VERs").[123] The subsidies talks started with a review of the rules and their inadequacies, and discussions coalesced around the "traffic light" approach sorting subsidies into "red" (prohibited), "green" (permitted), and "amber" (actionable) categories.[124] In the subsidies and antidumping areas, U.S. negotiators sought to fix the holes in the Tokyo Round Subsidies Code while defending U.S. antidumping and countervailing duty practices. U.S. proposals to punish input dumping, input subsidies, dual pricing of exports, industrial targeting and repeated dumping, and to permit primary agricultural producers to obtain relief against dumped or subsidized imports of their product in processed

form, echoed legislative proposals that had surfaced in Congress during the 1980s. In the group reviewing GATT articles, the U.S. offensive agenda included taking on the use of GATT balance of payments provisions as the basis for long-standing import restrictions, and a proposal for tightening GATT rules on state trading (responding to farm sector concerns). The EC targeted the unpopular U.S. "Section 22" waiver with a proposal to require termination dates for all waivers.

The TRIPS negotiations were difficult from start to finish. In the first two years, the trade negotiators in the group learned intellectual property law together. While developing countries argued that the group should only work on trade in counterfeit goods, the United States led developed countries in seeking an agreement to provide minimum standards for intellectual property rights protection and enforcement under domestic law, for patents, trademarks, copyright, trade secrets and semiconductor layout designs–obligations that would be backed up by GATT dispute settlement.[125] The U.S. agenda responded to concerns of major U.S. exporting industries such as chemicals, motion picture, software and pharmaceuticals, concerns strongly supported by the mainstream of the U.S. business community and the Congress.

The United States also took a leading role on the other "new issue" area, trade-related investment measures, tabling an ambitious proposal targeting thirteen types of measures imposed on investors–ranging from local content restrictions to restrictions on what an investor could produce, remittance requirements, technology transfer requirements, export performance requirements and limitations on foreign equity.[126]

The final two negotiating groups, on dispute settlement and on the functioning of the GATT system, dealt with cross-cutting institutional issues that were high priorities for the United States: in the 1988 Act, Congress had mandated a more effective GATT dispute settlement system as its number one specific priority for the Round. The dispute settlement talks, led by Ambassador Julio Lacarte, started quickly and soon reached agreement on a package of procedural improvements, including a right to establishment of a dispute settlement panel to consider a dispute. U.S. negotiators went further, seeking to end the losing party's ability to block adoption of an unfavorable panel report and its ability to block authorization of suspension of concessions if it did not comply with the panel rulings. The EC in return tabled a proposal aimed at Section 301 to require GATT contracting parties to use dispute settlement rather than a unilateral determination of wrongdoing, and to ensure that domestic law would conform to this rule.[127] The EC proposal would gather wide support after Super 301, and become the genesis of Article 23 of the DSU and Article XVI:4 of the WTO Agreement. The group on functioning of the GATT system, led by the late Ambassador Julius Katz, focused its work on review of country trade policies, drawing up the Trade Policy Review Mechanism ("TPRM") procedures that were later adopted in the midterm review. They also agreed that there should be periodic meetings of GATT at ministerial level.

C. Mid-Term Review in Montreal and on to Brussels

The Montreal Ministerial Meeting convened in December 1988, after the U.S. presidential election, for Clayton Yeutter's last meeting as the USTR. The Ministers and their delegations were successful in gathering a small early harvest of decisions on dispute

[125] *See id.* at 130–138.
[126] *See id.* at 138–140.
[127] *See id.* at 147–151.

settlement[128] and on functioning of the GATT system,[129] as well as a package of market access improvements for tropical products. But on agriculture, the United States held firm and the EC did not have a mandate to negotiate the changes demanded by its trading partners. And rather than accept an agreement to disagree on agriculture, the five Latin American members of the Cairns Group[130] blocked any agreement at Montreal. The meeting was suspended until April 1989.

In the early months of 1989, senior officials met informally in Geneva to resolve the four areas that had been unresolved at Montreal: agriculture, textiles, safeguards and TRIPs. They reached agreement on an agriculture framework with something for every group in the negotiations, setting a December 1989 deadline for detailed proposals; the TRIPS text incorporated the U.S. objectives of minimum standards and effective enforcement of intellectual property rights. In April 1989, the TNC then adopted the package of Montreal results with the remaining texts, creating the framework and blueprint for the final negotiations.[131] However, it would be years more before final agreements could be reached. From a U.S. perspective, the mid-term results were only important because they kept alive all the U.S. major priorities, not because they guaranteed success.

The debate over agriculture dominated the eighteen months between April 1989 and the next milestone, the Brussels Ministerial meeting scheduled to close the Round in early December 1990. The participants were still very far apart. The U.S. proposal of December 1989 moved minimally off the initial U.S. position: it demanded tariffication of border barriers without exceptions, with minimum access for imports at five percent of the domestic market; discipline on domestic subsidies based on sorting them into permitted/non-distortive, disciplined, and prohibited categories; and a phase-out of all export subsidies over ten years. The EC in return proposed use of Aggregate Measurement of Support ("AMS") as a tool to limit export and domestic subsidies, and accepted tariffication; the food-security group of Japan and Korea were unwilling to give up border protection or domestic subsidies. From April 1990 onward, eight major participants worked informally to reach agreement, without avail, as Aart de Zeeuw, chairman of the negotiating group, worked on his own synthesis. The de Zeeuw paper, circulated in June, proposed tariffication with special solutions for some products, and safeguards against import surges; phased reduction of all domestic support except that which was not tied to production ("decoupled"), based on the total AMS in 1988; and some reduction in export subsidies.[132]

The final proposals on agriculture before the Brussels meeting doomed any possibility of a successful close to the Round at that time. The EC's proposal took so long to negotiate internally that it was not submitted until November 1990. It proposed thirty percent cuts in domestic support from a base year of 1986, no commitments on export subsidies or import access, and a right to "rebalance" by increasing tariffs and subsidies on some

products as subsidies on other products were reduced. 1986 had been an unusual year, with high subsidy levels, with the result that much of the thirty percent cut in subsidies had already taken place by 1990. In contrast, the United States and Cairns Group sought ninety percent cuts in export subsidies over ten years, 75 percent cuts in domestic support, tariffication with tariffs reduced over time, and different base years (the United States proposed use of 1986–88 averages).[133]

There were also major clashes between the United States and most other players over the services agreement. The April 1989 package of mid-term decisions had agreed to include an MFN clause in the future services framework agreement.[134] By July 1990, agreement had emerged on the "bottom-up/top-down" scheduling formula adopted in the final agreement, in which commitments would cover only the sectors positively listed, but for those sectors would be comprehensive save for explicitly-listed exceptions.[135] The great majority also wanted the framework agreement and its MFN clause to cover all services sectors. Yet U.S. negotiators had learned during negotiation of the free trade agreement with Canada that Congress would veto any commitments on maritime transportation; in air transport, U.S. industry strongly favored the existing bilateral, non-MFN regime; U.S. telecom companies wanted to exclude basic telecommunications services from MFN; and the Treasury Department and the financial services industry wanted to be excluded from the GATS regime, or to reserve the benefits of market opening for like-minded countries.[136] If MFN was a universal obligation and national treatment and market access would have to be negotiated for each country sector by sector, from the U.S. point of view the MFN obligation would lock in its already-open market, and the United States would not have the ability to deny market access to individual countries that had refused to make a national treatment or market access commitment. This, from the U.S. point of view, created an asymmetry that would allow "free riders" and that would make liberalization less likely. The impasse on the framework meant that negotiations on market access commitments would have to be left until after Brussels. Just before the Brussels meeting, the United States hardened its position on excluding sectors and tying MFN treatment to the level of market opening. The text sent to Brussels was full of brackets, indicating a lack of agreement.[137]

In addition, major areas of controversy had erupted between the United States and the EC in the field of TRIPS, prompted largely by major differences between their respective copyright regimes. The TRIPS negotiations had fully engaged, with many concrete proposals from all sides on the full range of issues. By mid-1990 the negotiating group was working on a composite draft text assembled by its chair, Ambassador Lars Anell of Sweden, and the Secretariat. But key issues remained outstanding before Brussels.[138]

In the rules area, 1989–90 saw agreement coalesce in some areas, while others still suffered from deep divisions or no agreement at all. Negotiations on preshipment inspection, rules of origin, and the Tokyo Round codes on customs valuation, licensing, technical barriers to trade, and on the GATT provisions on schedules, state trading, waivers, renegotiation of concessions, non-application, and provisional application, produced texts that

[138] *See id. at 251–256.*

were virtually or completely finished before Brussels. In safeguards, the pre-Brussels text[139] had resolved all issues but a short list including selectivity, now refocused as "quota modulation."

In the subsidies discussions, Michael Cartland, chair of the negotiating group, developed a negotiating draft text which formed the basis of discussions from June 1990 onward, and eventually became the Agreement on Subsidies and Countervailing Measures. The Cartland text adopted the U.S. proposal to ban all export subsidies, including *de facto* export subsidies, as well as subsidies linked to purchases of local products. It defined subsidies as involving a financial contribution by a government, and incorporated proposals on "green light" subsidies which the United States was reluctant to accept. But U.S. negotiators were under pressure politically to deliver: even up to Brussels, the United States continued to push for prohibiting certain types of domestic subsidies seen in the steel sector.[140] In the antidumping area, Asian exporters and developing countries pushed strongly for more discipline, but U.S. domestic political pressure was strong to resist any changes that would make it more difficult for domestic industry or unions to successfully petition for antidumping duties on imports. The United States and EC even proposed extending antidumping remedies to cover circumvention of an antidumping order. After two attempts at pleasing both opposing poles, the Secretariat gave up. Negotiations broke down in mid-October 1990, further attempts at compromise were rejected by the United States, the EC and others, and no text was sent to Brussels.[141]

The United States also found itself isolated in the effort to resolve the methodology for tariff negotiations. While most countries wanted negotiations based on a formula cut in tariffs (although few of them could agree on exactly the same formula) the United States had insisted that it would proceed only in an item by item mode. Tariff negotiations were also held back by linkage to agriculture: until it was clear how agricultural market access would be negotiated, an entire area of tariff bargaining was off the table. The United States offered zero tariffs for agricultural products. In an initiative pushed by U.S. exporters, the United States then made "zero-for-zero" offers for a range of industrial products, conditional on agreement by others also to go to zero.[142] But a perceived gap in offers by developing countries made it difficult politically for U.S. negotiators to offer concessions on import-sensitive products such as textiles and footwear, the products most of interest to developing countries.

The year 1990 also saw the birth of an idea that would travel far, as first the Canadian government tabled an April 1990 proposal to create a new World Trade Organization, and then the EC tabled its own outline proposal for a Multilateral Trade Organization ("MTO"). The United States, seeing an MTO as a distraction from the substantive business of the Round, opposed it consistently up to December 1993. The MTO idea nevertheless made it into the package of texts forwarded to the Brussels Ministerial. Work also advanced on dispute settlement, as the group tackled the issues left unresolved by the mid-term decision—adoption and implementation of panel reports. To address barriers to adoption, the EC proposed appeal procedures for panel reports, with the support of the United States. Spurred on by Super 301, the EC and others made curbs on unilateralism a key priority for the dispute settlement talks; the United States responded that unilateralism included unilateral blockage of the panel process, and could only be

[139] MTN.TNC/W/35/Rev.1 (Dec. 3, 1990), at 183–192.
[140] *See* Croome, *supra* note 80, at 173–179.
[141] *Id.* at 180–183.
[142] *Id.* at 158–161.

addressed when rules would eliminate such blockage. The text that went to Brussels included the creation of an Appellate Body, but was not clear whether the new procedures would also apply to the Tokyo Round codes. Issues left open were automatic adoption of panel reports, anti-unilateralism rules and coverage of non-violation nullification or impairment.[143]

D. From Brussels to the Dunkel Draft

The Brussels Ministerial opened on Monday, December 2, 1990 with vows by all to finish at Brussels. After three days in which the EC repeatedly refused to move from its initial position on agriculture, Swedish Agriculture Minister Mats Hellstrom, chair of the agriculture negotiating group, put forward a tentative compromise "non-paper" on Thursday. On Thursday night, after EC Agriculture Commissioner Ray McSharry refused to accept the Hellstrom non-paper even as a basis for negotiations, Latin delegates started a walkout, first from the agriculture group and then from all groups. On Thursday night, when Ambassador Hills told the assembled representatives of the U.S. business community that the United States had walked away from a bad deal, they gave her a standing ovation.[144]

On Friday morning, the TNC formally suspended the meeting.[145] The Round was extended for a brief period for consultations to be held by Director-General Dunkel in early 1991. Ambassador Hills declared that the United States would return to the negotiating table when a basis existed for successfully concluding the Round—making it clear that the EC would have to be willing to negotiate on the full range of agriculture issues, including export subsidies as well as domestic support and market access.[146]

After Brussels there was a three-month break in official negotiating sessions, the first of the periods of marking time that characterized the last half of the Uruguay Round. In the period between 1988 and 1990, even though some crucial deadlines had been missed, work had moved forward steadily toward meeting the overall deadline of June 1, 1991 for fast-track implementation set by the U.S. 1988 Act.[147] The breakdown at Brussels, soon complicated by the start of the Gulf War, made it clear that the U.S. Administration would have to use the fallback that had been provided in the 1988 Act, and ask Congress by March 1, 1991 to grant a two-year extension on fast-track, to June 1, 1993. Ambassador Hills met with EC Commissioner Andriessen, as the rest of the GATT waited. On February 26, the TNC re-launched negotiations by adopting a work program that included agreement by all-including the EC-to "conduct negotiations to achieve specific binding commitments" in all three agricultural areas—export subsidies, domestic support and market access. The work program provided negotiating plans for all unresolved issues in the Round.[148] In April, the negotiating structure for the Round was consolidated into six groups, on market access, textiles, agriculture, rulemaking, TRIPS and institutions.[149]

Extending fast-track would not prove easy for the Bush Administration. In 1990, President Bush had accepted Mexican President Salinas' request to negotiate a free trade agreement. After Canada asked to be included, on February 5, 1991 the three countries announced their intention to pursue a North American free trade agreement.[150] The fast-track extension would apply to the NAFTA talks too, not just the Uruguay Round. Under the 1988 Act, either the House or the Senate had the right to veto an extension of fast-track through a one-house disapproval resolution, which could not be vetoed by the President. Organized labor and environmental groups mobilized to fight free trade with Mexico. The Congressional leadership decided that to retain the credibility of fast-track and the agreements, the resolutions could not be simply killed in committee, and would have to go to floor votes. The same business coalition that had pushed for the 1988 Act came out again, President Bush and USTR Carla Hills lobbied and provided assurances on labor and the environment, and disapproval of the extension was rejected by comfortable, but not overwhelming margins on May 23 and 24.[151] But NAFTA became the catalyst for the formation of a new "anti-trade" coalition in the United States–labor unions, environmental groups, import-sensitive small businesses, populist-oriented family farm groups, and other NGOs—one that was increasingly dissatisfied with a perceived policy bias in favor of trade liberalization over all other policy objectives. This coalition of interests that emerged in the NAFTA debate was to grow in strength throughout the remainder of the Round.

In June and July 1991, negotiating groups began to meet again, and in July delegations agreed to intensive meetings in the late fall, with the objective of finishing in 1991. The Quad worked actively, both at senior level and at the technical level. The negotiations in Geneva began to make quiet progress. Although fundamental blockages still remained on agriculture, services, TRIPS and textiles, the shape of a final agreement began to emerge. The idea of a unified dispute settlement mechanism and a new multilateral trade organization to replace GATT began to take shape. Enormous gaps still remained in the various positions, but U.S. negotiators began to gain more confidence in the prospects for an overall agreement that could be sold at home. The negotiations built to a peak in late November and December, when most remaining issues were resolved in negotiations. The deadline to close out negotiations was midnight December 18, 1991, to enable preparation of a complete draft Final Act for distribution at the TNC meeting on Friday, December 20. On December 19, the chairmen of the six groups made their final cut on the few unresolved issues, filling in the blanks based on their own judgment and knowledge of what delegations would tolerate.

Developments in Europe freed agriculture to move. In July, the EC Commission adopted EC Agriculture Commissioner Ray MacSharry's plan for CAP reform, and in mid-October, the EC negotiating position shifted to embrace the possibility of more reductions in domestic support and specific commitments to limit export subsidies. In meetings with EC Commission President Jacques Delors on November 10, President Bush moderated the earlier U.S. position, arguing for a 30–35 percent cut in export subsidies over five or six years.[152] But two months of intensive meetings did not produce agreement on agriculture, and so the key elements of a deal were left to the judgment

of GATT Director-General Arthur Dunkel, as chairman of the agriculture negotiating group. Dunkel's draft text opted for tariffication of import barriers without exceptions, with 5 percent minimum access staged in, and a 36 percent average reduction in tariffs; "green box" status for decoupled payments to farmers and a 20 percent cut in domestic support from 1986 levels, over the 1993–99 period; and for export subsidies, a 36 percent cut in budgetary outlays and a 24 percent cut in volume of subsidized exports, over the same period.[153]

Services negotiators worked hard throughout 1991 as the negotiating group circulated a series of complete texts and many partial proposals. The United States continued to resist an unconditional MFN obligation because of the free rider concerns discussed earlier. Finance ministry negotiators sought to negotiate a separate annex for financial services that could provide special rights and obligations for a club of the like-minded, richer countries, and a lower level of benefits for those countries not willing to take on more obligations.[154] But at the end of 1991, little of substance remained in the financial services annex to GATS except for a broad carveout for prudential measures. Other delegations had proposed handling the MFN problem through individually-negotiated MFN exemptions for particular national measures. In the Dunkel Draft text, negotiating group chairman Felipe Jaramillo opted to allow any participant to take MFN exemptions on a one-time basis at the entry into force of the GATS, but to have the GATS cover all sectors. This balance suited many participants in the end. The MFN exemptions would prove useful not just for the United States but for others; the coverage decision meant that Europe could not *a priori* exclude the audiovisual sector.[155]

The other difficult areas were antidumping and TRIMs, where no texts had been sent to Brussels, and there was no easy way to restart negotiations. Views in the negotiating group on rules were sharply divided between exporting countries, particularly those in East Asia, and the users of antidumping. Exporters were reacting to a sharp rise in investigations taking place in the early 1990s.[156] On the other hand, negotiators of the United States and the EC, the leading users of antidumping, were beginning to feel intensified pressure from domestic groups as they lost GATT or Code disputes on their antidumping measures. When the Antidumping Code panel in the 1990 *Swedish Steel* case[157] called for the U.S. authorities to revoke the antidumping order at issue and reimburse the duties, the panel recommendation became a lightning rod for U.S. groups. In the absence of agreement, the chairman of the negotiating group stitched together a text on antidumping as a best approximation of a compromise between conflicting positions, and that "chairman's text" appeared in the Dunkel Draft.[158] The TRIMs text was a "chairman's text" as well.[159] By contrast, the TRIPS text came together quickly in December 1991, with its key compromises agreed between negotiators on minimum

patent term, extension of patents to all subject areas, transition periods for developing countries, and interim provisions for the transition period. This text essentially completed the TRIPS negotiations.[160] The final text on textiles and clothing came together in a series of all-night negotiating sessions in December.[161]

In hindsight, the most fundamental breakthrough came in the work on institutions. The Quad had already discussed the MTO extensively from 1989 onward. As the negotiating group on institutions deliberated in the fall of 1991, the United States pushed again for a breakthrough against blockage of panel reports, and for the integrated, comprehensive dispute settlement system that would be required in order for the GATS and TRIPS to be effectively enforced. The group began to work on the MTO as well. Just before the deadline, it agreed on a long dispute settlement text incorporating U.S. acceptance of a limited anti-unilateralism commitment, in exchange for agreement that panels would be established, panel and Appellate Body reports would be adopted, and retaliation would be authorized, on request except if there were consensus otherwise (the "negative consensus" approach). Another short text provided for handling of all disputes by a new Dispute Settlement Body and for "cross-retaliation" under carefully-specified conditions. These agreements and a draft MTO text were all included in the Dunkel Draft, providing the first textual basis for knitting the single undertaking of the Punta del Este Declaration into a comprehensive legal structure.[162]

E. To Blair House and Beyond

Reactions to the Dunkel Draft were mixed. The EC immediately rejected the text on agriculture, U.S. agricultural interests criticized it as not going far enough, and the Cairns Group accepted it.[163] Environmental NGOs complained that the agreements would leave no room for environmental regulation. Nevertheless, the text was a watershed moment that did more than any other single event to propel the negotiations towards a final conclusion. In January, the TNC agreed to use the Dunkel Draft as the basis for negotiations, and to move forward on four tracks: one, intensive negotiations on market access in goods; two, intensive negotiations on market access in services; three, work on the legal conformity and internal consistency of the agreements; and four, work at TNC level on "examining whether and if it is possible to adjust the package in certain specific places."[164]

For the rest of 1992, the United States and EC negotiated bilaterally on agriculture, as the rest of the world waited for a breakthrough. In Geneva, the legal drafting group worked on the Dunkel Draft texts from January through early June. The group integrated the two dispute settlement texts into a single Dispute Settlement Understanding ("DSU"), and comprehensively redrafted the MTO Agreement. It edited the Dunkel Draft texts to make them into agreements that would all use the DSU procedures for dispute settlement, would be administered by the MTO and would be attached to the MTO Agreement. But the group could not make substantive changes, and some fundamental issues, such as amendment and waiver provisions, could not be settled. Similarly, the final deals could not be approached in the market access talks for goods and services because a key element,

[164] *TNC adopts four-track strategy to conclude the Round*, GATT FOCUS No. 87, Jan-Feb. 1992, at 2.

agriculture, was still unresolved. The United States participated in the "Track Three" talks on the MTO, while withholding its agreement to the MTO in principle. The controversy over NAFTA and the *Tuna-Dolphin* case had alerted USTR to the sensitivities that could be awakened by a new international organization in trade. Keeping focused on their key areas of agriculture and services, U.S. negotiators were also skeptical that arguments over the design of a new organization would distract the Uruguay Round from the real issues of substance.

The EC could not accept the Dunkel Draft because even after the 1991 MacSharry reforms of the CAP, EC payments to farmers were not completely decoupled from production levels and thus did not qualify for "green box" treatment. The draft had also not accepted Europe's desire to raise some tariffs (on oilseeds, for instance) as it cut others. MacSharry also sought explicit recognition of the 1991 reforms in the agriculture text.[165] The long-running dispute between the U.S and EC on oilseeds[166] then came to a boil in 1991–1992. In March, a panel found that the EC's payments on oilseeds, even post-reform, impaired the EC's zero binding by tying payments to the price supports and variable levy for grains.[167] On April 30, the United States announced its intention to suspend concessions on $1 billion in imports from the EC; on June 12 USTR announced a $2 billion list of candidate products to be targeted, and on June 19, the GATT Council authorized the EC to renegotiate the zero binding on oilseeds, precipitating EC-U.S. negotiations on compensation. After the September referendum in France on the Maastricht Treaty on European Union, negotiations could finally engage on the full range of agricultural issues, and for six weeks U.S. and EC negotiators met in different cities to discuss the outlines of a possible deal. Negotiations broke down on November 3; on November 4 the EC blocked a U.S. request to the GATT Council for authorization to suspend $1 billion in concessions, and on November 5, USTR announced $300 million in trade sanctions to apply starting December 5.[168]

Amid rumblings of trade war and calls by the GATT Council for renewed talks, the EC and the United States sat down again in Washington and reached the November 20 Blair House agreements, including an agreement resolving both the oilseeds dispute[169] and an agreed set of changes to the Dunkel Draft agricultural text.[170] The changes reduced the Dunkel cut in subsidized exports from 24 percent to 21 percent. The Blair House changes also created the "blue box," under which some direct payments under production-limiting programs would be excluded from the commitment to reduce domestic support: the "blue

[165] Interview, Kevin Brosch (former U.S. agriculture negotiator), 2003.

[166] In 1962, when the EC liquidated prior European tariff bindings on grains in order to establish its Common Agricultural Policy, the United States had negotiated a tariff binding at zero on non-grain feed ingredients including oilseeds; *see* note 42 *supra*. As the EC livestock industry grew in the following thirty years, so did imports of oilseeds used as ingredients for high-protein feed, vegetable oils and margarine. EC member states and the EC tried various tactics, then subsidized users to buy domestic oilseeds. A 1988 GATT dispute brought by the United States against the subsidies resulted in a panel report, adopted in early 1990, which found that the EC subsidies violated the EC's national treatment obligations and also impaired the zero binding on oilseeds. A new oilseeds payment regime was worked out in 1991 as part of the MacSharry Plan for CAP reform. After bilateral consultations, and under the pressure of Section 301, the EC agreed with the United States to refer the issue of EC compliance back to the original panel.

box" provisions were crafted to benefit both the EC and the United States.[171] Third, the Blair House changes introduced additional flexibility and "swing" into export subsidy reduction commitments; and fourth, the changes inserted a new "peace clause" into the text. In December 1992, the Bush Administration signed NAFTA, and continued on to try to wrap up the Round with the EC before Bush left office in late January. But the remaining gaps were too large to bridge, and others had agenda items as well. The Round would miss its extended deadline.

F. Finishing the Round, 1993

In 1993, the new Clinton Administration began to get organized to cope with NAFTA and the Round, under the new USTR, Mickey Kantor. The Administration started late and had to expend extra resources on securing Congressional approval of NAFTA, which became the major focus of effort from September until it passed the House on November 17. Meanwhile, Congress passed legislation extending fast-track, providing a deadline of April 15, 1994 for signing the agreement and December 15, 1993 for notifying Congress of the intent to sign.[172] After finally agreeing to EC Council approval of the oilseeds agreement on June 8, the French government, under increasing political pressure, sought to reopen Blair House.[173]

In December 1992, GATT Director-General Dunkel had started to surface delegations' Track Four proposals, to find that the United States wanted to revise the antidumping text, to scrap the MTO in favor of simpler arrangements under GATT, and to gain other changes responding to environmental concerns; the EC, Japan, Mexico, India, Canada and others had their wish lists as well.[174] After marking time in the spring, market access negotiations restarted in the summer. Between September and mid-November the Institutions Group, chaired by Ambassador Julio Lacarte of Uruguay, made the final decisions on the new integrated dispute settlement rules and the MTO, fixing the provisions on MTO decision-making that had been an obstacle to U.S. acceptance.

In meetings starting two days after the NAFTA vote, Ambassador Kantor and EC Commissioner Sir Leon Brittan focused on the Round. In three frantic weeks of nonstop meetings, they settled almost all their outstanding bilateral issues. In a final settlement negotiated in the first week of December in Brussels, the United States agreed to reopen the Blair House Agreement, to postpone cuts in subsidized exports and to extend the peace clause period to nine years. In return, the EC agreed to provide market access for particular agricultural products including binding the margin of preference for grains,[175] to reduce tariffs on electronics and other industrial products,[176] and to support U.S.-backed antidumping and subsidies proposals.[177]

[171] The provisions appearing in Article 6.5(a)(i) of the present Agreement on Agriculture were tailored to shelter the MacSharry payments on fixed areas and fixed yields, and Article 6.5(a)(iii) extended the principle to the livestock area. Article 6.5(a)(ii) sheltered the pre-1996 U.S. deficiency payment program. Brosch interview.

During the last week before December 15, in Geneva, the United States succeeded in negotiating the antidumping changes it had needed to satisfy Congressional critics, talking other delegations into acceptance of special provisions on the standard of review that had been opposed by the great majority.[178] More and more of the texts fell into place, and dramatic tariff cuts finally materialized in the market access talks. In the last three days, the services talks closed out with agreement to postpone the debate on MFN in financial services and basic telecom to separate talks to be held after the Round. The EC withdrew its offers on audiovisual services, and the last adjustments were agreed in the TRIPS Agreement.[179] And the United States finally accepted the MTO framework for putting the Round results into effect, with one demand: that the name be changed to the more euphonious "World Trade Organization."

On December 15, 1993, Director-General Peter Sutherland brought down the gavel at a meeting of the TNC to signal the end to substantive negotiations and a consensus among all of the participants in the Round. The negotiations had taken seven agonizing years, and the agreements put in place represented, without question, the most massive overhaul in the multilateral trading system since the GATT began.

This massive change in the trading system had been the goal of the United States from the beginning of the negotiations, and now, for better or worse, the United States had what it wanted. But the battle for acceptance of the agreement would not be easy. Supporters of the agreement argued that all of the basic U.S. objectives for a strengthened system had been achieved. There was now a more binding and automatic dispute settlement system whereby countries could not block panel decisions. A single undertaking meant that all parties would have to live by roughly the same rules, albeit with special rules and longer phase-ins for developing countries. Services and TRIPS were an integral part of the rules. The United States had achieved much of its objectives for greater market access in the tariff and services negotiations. A much stronger subsidy agreement limited the use of trade-distorting industrial subsidies and went far beyond the weak Tokyo Round agreement. Agriculture rules had been firmly imbedded in the new system, and commitments to tariffication and reduction of subsidy levels and import protection had been achieved, albeit modestly. Although the final agreement on agriculture was nowhere near the initial U.S. position, it was a huge advance over the *status quo ante* and it created a framework for further advances in the years to come.

Many industry groups, multinational companies and agricultural associations were pleased with this sweeping outcome. These groups would, over the following months, form a powerful coalition to lobby for acceptance of the agreement by the Congress. They would argue that the United States was by far the largest beneficiary of an agreement that finally recognized the key strengths of the U.S. economy—its innovation, its productivity and its orientation towards high technology, services and agriculture.

However, there were many divisions within the United States as to the acceptability and wisdom of the final agreement. In order to obtain its goals, the U.S. government had also made concessions in many areas: agreement to phase out textile quotas, elimination of "grey area" measures (e.g., voluntary export restraints), tough new rules limiting the use of antidumping measures, reduction of domestic agricultural supports and protection,

reduction of tariffs on a number of import-sensitive products, and a dispute settlement system that would limit the use of Section 301 in cases covered by WTO rules. These changes would surely face opposition from organized labor, import-competing industries and advocates of unilateral trade measures. Many critics of the agreement saw these trade-offs for a more effective multilateral system as unacceptable.

Opposition to the agreement would also come from NGO groups—particularly environmental and labor organizations—who saw multilateralism as a new threat, one that could bring changes in existing regulatory safeguards or limit the ability of Congress to pass new laws using international trade sanctions in defense of labor rights or environmental objectives. This opposition had started with the fight in spring 1991 against fast-track renewal for NAFTA and the Uruguay Round, and the September 1991 GATT panel ruling condemning U.S. "tuna-dolphin" trade sanctions,[180] which was like a spark on dry tinder. The *Tuna-Dolphin* panel ruling galvanized opposition to the GATT and to the WTO in ways that few old trade hands had ever anticipated. It created deep divisions between those groups who supported the philosophy of trade-led growth and those who advocated other social policies, and saw inherent conflicts between enhanced trade and these broader goals. While the latter groups were to remain a minority of public opinion throughout the debate on the Uruguay Round, their vocal condemnation of an agreement that they viewed as eroding U.S. sovereignty aligned them with organized labor and textile and steel executives. In the end, an alliance evolved between liberal social activists and conservative isolationists or unilateralists—an alliance best typified by the many joint appearances by Ralph Nader and Pat Buchanan in opposition to the Uruguay Round. These groups, together with industry and labor groups fighting a loss of protection, would coalesce around an effort to defeat the Uruguay Round implementing legislation in Congress.

G. The Uruguay Round Agreements Act

As 1994 began, the final cleanup of the agreement started in Geneva. A new legal drafting process did a final legal cleanup on the texts in all three languages, and market access negotiators finalized the schedules of concessions; in Marrakesh, Ministers met, made speeches and were photographed at the signing ceremony. Approval of the legislation took almost a year of overcoming obstacles in its path.

The fast-track provisions for the Uruguay Round meant that an implementing bill could not be delayed by a Congressional committee indefinitely, but would have to be reported out within 45 legislative days, and it would be voted on promptly by each House of Congress; the maximum period for consideration would be ninety legislative days. These deadlines would be triggered by submission of the trade agreements, a draft implementing bill, a statement of any administrative action proposed to implement the agreement,[181]

[180] *United States—Restrictions on Imports of Tuna*, BISD 39S/155 (1991, unadopted), regarding the U.S. Marine Mammal Protection Act and the Dolphin Protection Consumer Information Act.

[181] The fast-track authority in Section 1103(a) of the 1988 Act (19 U.S.C. 2903(a)), like the fast-track authority in the Trade Act of 1974, required that the President submit "a statement of any administrative action proposed to implement the trade agreement" with the draft implementing bill for the trade agreement. Section 101(a) of the Uruguay Round Agreements Act (19 U.S.C. 3511(a)) explicitly approved the statement of administrative action submitted with the Uruguay Round agreements. Section 102(d) (19 U.S.C. 3512(d)) provides that this statement of administrative action "shall be regarded as an authoritative expression by the United States concerning the interpretation and application of the Uruguay Round Agreements and this Act in any judicial proceedings in which a question arises concerning such interpretation or application."

and supporting information (including explanations of how the bill would affect existing law and how it met the objectives specified in the 1988 Act). The implementing bill would be drafted by USTR, negotiating with the Congressional committees of jurisdiction, and would go through sessions just like legislative markups and a conference process between the House and Senate. This drafting process would take place between the date that the United States entered into the agreement (at Marrakesh) and some later unspecified time when the package was submitted to Congress.[182] The Uruguay Round package was not submitted to Congress until September 27, 1994, shortly before Congress was due to adjourn.

Why the delay? I.M Destler's expert account points to the distraction of the larger struggle over the Clinton Administration's health care bill, the weakness of Congressional trade leadership compared to 1988, and the budgetary requirement to find sources of revenue that would pay for the $12 billion in tariff revenue losses resulting from the bill. Destler also points to two factors that were within the Administration's control: the handling of revisions to the antidumping laws, and the Administration's forward-leaning proposal for extending fast-track authority.[183]

Antidumping petitioner interests had opened the year with a wish list of changes to the antidumping laws and how they would be administered,[184] and it was clear to USTR that there would be a price for the Uruguay Round changes. It took months for USTR to negotiate the details. Destler remarked at the time that "supporters of AD laws appear to have won back in Washington most, but probably not all, of the ground lost in Geneva."[185] These changes bought the bill solid support from influential "fair traders" in Congress, but in later years they were the source of many of the WTO disputes brought against U.S. trade remedies.

The Clinton Administration also chose to try to use the implementing bill as a vehicle for a seven-year renewal of fast-track authority for future Clinton trade agreements. Fast-track renewal would be controversial in any event, since the only upcoming trade negotiations were free-trade talks with Chile. To try to persuade Democrats, the proposal tied fast-track to negotiating objectives that included respect for internationally-recognized labor standards, and harmony between trade rules and environmental protection. But the linkage between environment, labor and trade triggered the strong opposition of the business community and Republican supporters of free trade.[186] For every Democrat or union supporter unwilling to open the borders unless trading partners had labor and environmental laws equal to those in the United States, there was a Republican or a business community member totally opposed to having trade agreements that would trade off market opening for social goals, or could result in trade sanctions on the United States if U.S. labor or environmental laws were found to be inadequate. Between June 20 when the proposal was made, and September 12 when it was abandoned, much time and effort was lost.[187] Another Clinton Administration attempt at gaining new fast-track authority in 1997 would also fail, and fast-track would prove elusive until the Trade Act

[182] Section 151 of the Trade Act of 1974 (19 U.S.C. 2191). Legislative days do not include days when the Congress is not in session or the session is recessed; a period of 45 legislative days may be significantly longer than 45 calendar days.

of 2002, which would finally provide "trade promotion authority," the new term bestowed by USTR Robert Zoellick.

The central "big picture" issue for the debate on approval of the Uruguay Round was the alleged threat to U.S. sovereignty of U.S. WTO membership and the un-blockable WTO dispute settlement system that U.S. negotiators had worked so hard to bring about. To deal with these issues, the implementing bill included provisions confirming that the WTO agreements do no override Federal or state law, and providing special procedures for coordination with state governments in disputes involving state laws.[188] To satisfy House Minority Leader Newt Gingrich, the bill included a provision providing for an expedited process for Congress to review U.S. participation in the WTO each five years, and vote to revoke approval of the WTO Agreement if it chooses.[189] These provisions require USTR's annual report to Congress to discuss any WTO decision taken by vote.[190] Criticism of the secrecy involved with the panel process led to provisions in the bill requiring USTR to make U.S. dispute settlement submissions public when filed, and to pursue greater transparency in the WTO.[191]

The House and Senate conferees did not finish until September 23, the package was submitted September 27, and on September 28, Senator Ernest Hollings, chairman of the Senate Commerce Committee, announced that he would insist on holding the bill in his committee for the full 45 days, blocking an early vote. The result was to delay the vote until after the November elections, in which Republicans gained majority control of both the House and the Senate. The new majority leader of the Senate, Senator Robert Dole, then announced his support in exchange for a few more concessions. In a letter to Dole, the Administration promised to support legislation in 1995 to establish a Dispute Settlement Review Commission of five Federal appellate judges. The commission would review all panel or appellate reports adverse to the United States, and determine whether the panel had demonstrably exceeded its authority, altered treaty rights and obligations, acted arbitrarily or capriciously, engaged in misconduct or departed from standard procedures; if there were three instances in a five-year period, Congress could vote to withdraw from the WTO.[192] The Uruguay Round bill then went through quickly by a comfortable margin with bipartisan support. President Clinton signed it into law on December 8, 1994.

Also on December 8, the Preparatory Committee for the WTO held the Implementation Conference provided for in the Final Act of the Uruguay Round. The Implementation Conference formally adopted January 1, 1995 as the WTO's start date, and, responding to U.S. plans to withdraw from the GATT as soon as possible, it adopted arrangements to wind up the GATT 1947 and the Tokyo Round Codes.[193] When the WTO era began

on January 1, the GATT 1947 quickly became irrelevant, and the new single undertaking negotiated in the Uruguay Round took its place. The GATT, which had never formally entered into force, was terminated at the end of 1995, ending an era in trade.

VII. The WTO's First Seven Years: Negotiations and Implementation

We address now the interaction of the United States with the WTO's negotiating and implementation agenda. U.S. work within the WTO started with the basics: following up to ensure full WTO implementation, carrying out the built-in agenda of negotiations provided for in the WTO Agreement, and actively pursuing accession negotiations with China and other countries seeking to join the WTO. To these were added initiatives seeking to expand the WTO's reach to new subjects and the new economy of the Internet. Carrying out the commitment in the WTO Agreement to ministerial meetings every two years, the WTO held successful ministerial meetings in Singapore in December 1996 and Geneva in May 1998. After an unsuccessful meeting in Seattle in November 1999, the WTO launched a new round of trade negotiations at the Doha Ministerial Meeting in November 2001.

A. Laying the Foundations

During the first years of the WTO, the United States worked with other Members to establish the WTO's institutional machinery, including rules of procedure for WTO bodies, a headquarters agreement and an independent Secretariat. During 1994, one set of waivers and the accession of Ecuador were approved by vote. Soon thereafter, the WTO General Council agreed that waiver and accession decisions would be agreed by consensus unless a Member requested that a vote take place.[194] There have been no votes in the WTO since 1995.

Assuring greater WTO transparency to civil society has been a continuing major U.S. concern. Starting in 1995, U.S. negotiators proposed new rules to eliminate the GATT rule that all documents would be "restricted" and denied to the public until action had been taken to derestrict them. The WTO adopted liberalizing procedures on document access in 1996 and 2002 which have completely reoriented the WTO on the issue of document restrictions, with the result that in principle all WTO documents are unrestricted.[195]

of Withdrawal From or Termination of the Agreement on Implementation of Article VI of the GATT, BISD 41S/16; *Consequences of Withdrawal From or Termination of the Agreement on Interpretation and Application of Articles VI, XVI and XXIII of the GATT*, BISD 41S/18; all adopted Dec. 8, 1994.

[194] *Decision-making Procedures under Articles IX and XII of the WTO Agreement*, Statement by the Chairman, as agreed by the General Council on November 15, 1995, WT/L/93. "On occasions when the General Council deals with matters related to requests for waivers or accessions to the WTO under Articles IX or XII of the WTO Agreement respectively, the General Council will seek a decision in accordance with Article IX:1. Except as otherwise provided, where a decision cannot be arrived at by consensus, the matter at issue shall be decided by voting under the relevant provisions of Articles IX or XII. The above procedure does not preclude a Member from requesting a vote at the time the decision is taken. Consequently, if any Member has a particular problem with a proposed decision regarding a request for a waiver or an accession to the WTO, it should ensure its presence at the meeting in which this matter will be considered. The absence of a Member will be assumed to imply that it has no comments on or objections to the proposed decision on the matter."

[195] *Procedures for the Circulation and Derestriction of WTO Documents, Decision of 18 July 1996*, WT/L/160/Rev.1, *replaced by Decision on Procedures for the Circulation and Derestriction of WTO Documents, Decision of 14 May 2002*, WT/L/452. The 2002 decision provides that "All official WTO documents [defined as documents in certain WTO series] shall be unrestricted"; certain types of such documents

As mandated under the Uruguay Round Agreements Act, the United States initiated discussions on rules of conduct for panelists and the Appellate Body, which were approved in December 1996.[196] In response to another U.S. initiative, the WTO adopted a decision on relations with non-governmental organizations, adopted in 1996.[197]

The WTO committees administering the agreements spent their first few years actively reviewing implementing legislation notified by Members. The United States reviewed others' legislation and was reviewed itself. The committees, and the other specialized bodies, also took necessary decisions and created necessary institutions to do foundation work for the next round of trade negotiations, and to pursue the "built-in agenda" flowing from the Uruguay Round agreements.

B. The Built-in Agenda

The Uruguay Round negotiations on services and agriculture broke new ground by establishing new frameworks for applying trade rules and making new types of legal commitments in these sectors. But it was clear that only partial results could be achieved before the gavel went down on the Uruguay Round. Further work would need to be done, in new negotiations that the negotiators scheduled to start five years after the entry into force of the WTO Agreement, in the year 2000.

In the services area, the major accomplishment of the negotiations was to establish the GATS itself, but many of the market access commitments made in the Uruguay Round went no farther than binding the status quo. Two sectoral negotiations that took place in 1995–97 would prove important in keeping the support of the U.S. business community for multilateral trade liberalization, by demonstrating that market opening in services could happen in multilateral negotiations.

In December 1993, the U.S. financial services industry's unwillingness to open the U.S. market on an MFN basis triggered a decision by the TNC not to finish negotiations on financial services, but to hold a sectoral negotiation on financial services that would be scheduled to conclude by July 31, 1995. When that deadline arrived, and the United States still believed that offers on the table were inadequate, the deadline was extended and further talks were held. When the negotiation finally concluded in December 1997, it produced agreed commitments covering $18 trillion in global securities assets, $38 trillion in global domestic bank lending, and $2.2 billion in worldwide insurance premiums.[198]

A similar story took place in the basic telecommunications area. Most of the commitments agreed in the Uruguay Round were in value-added telecommunications. Rather than exclude basic telecommunications from the GATS, the TNC agreed to hold a sectoral negotiation in this area to conclude by April 30, 1996. At that deadline, the negotiators decided to recess and reconvene for a month early in 1997. Efforts during the interim

are issued with temporary restricted status but automatically derestricted, and although a government can request that such a document that it submits be given restricted status, the government must positively request continued restriction or the document will be automatically derestricted. Restricted documents still exist, but are simply not issued in the "official" series listed in L/452. However, the share of WTO documents that are restricted now is tiny compared to the share of GATT documents that were restricted as of 1994.

[198] *See* informal Secretariat summary of financial services commitments agreed in December 1997, at http://www.wto.org/english/news_e/news98_e/finsum.htm.

period resulted in a successful conclusion, with commitments covering more than 95 percent of the global market for telecommunications services. An important U.S. initiative was drafting and advancing a "Reference Paper" of pro-competitive regulatory principles, as a way for individual Members to commit voluntarily to maintaining a regulatory environment conducive to market entry.[199]

Agricultural reform too was only half begun in the Uruguay Round. Article 20 of the Agreement on Agriculture recognized that "the long-term objective of substantial progressive reductions in support and protection resulting in fundamental reform is an ongoing process" and provided that negotiations for continuing the process would be initiated in 2000. As the year 2000 approached, the WTO Committee on Agriculture began technical work to prepare for the negotiations, and that work continued until the launch of the Doha Round.

C. New Initiatives

As discussed above, the WTO Agreement requires that the WTO meet at Ministerial level each two years, and the agreement itself guaranteed that a new round of negotiations would start around 2000. It was no surprise, then, that the Singapore Ministerial Meeting of December 1996 became the scene of a debate over whether and what items would be added to the agenda in those future negotiations. At Singapore, and in bilateral, Quad and APEC meetings beforehand, the United States pushed strongly for the immediate launch of negotiations to achieve a multilateral agreement on transparency in government procurement (a limited agreement which would not open procurement markets but simply provide notice and transparency on bidding and award of contracts). The Singapore Ministerial Declaration chartered a working group "to conduct a study on transparency in government procurement practices, taking into account national policies, and, based on this study, to develop elements for inclusion in an appropriate agreement."[200] The EC had similar success advancing an initiative on trade facilitation, and the Singapore Ministerial Declaration tasked the Council for Trade in Goods "to undertake exploratory and analytical work, drawing on the work of other relevant international organizations, on the simplification of trade procedures in order to assess the scope for WTO rules in this area."[201]

The Clinton Administration also pushed for an opening for future talks on trade and labor rights–an issue of great importance to some in the Democratic party–but could not overcome widespread resistance. The Singapore Declaration renewed the commitment of all to observance of core labor standards–but the Declaration stated that increased trade would contribute to promotion of labor standards, rejected protectionist use of labor standards, and agreed that the competitive advantage of low-wage developing countries "must in no way be put into question."[202]

More controversial were the EC's main wish-list items of trade and investment, and trade and competition. Both were opposed by the United States and even more strongly opposed by developing countries. The U.S. preference (reflecting views of the U.S. business community) was to pursue investment issues in the OECD or bilaterally, not in the

WTO. U.S. skepticism on trade and competition reflected the opposition of both U.S. antitrust enforcers, and industry voices which sought to avoid displacement of antidumping remedies by competition laws. In the end, the Singapore Declaration launched working groups on both subjects, but at India's insistence, the Declaration text provided that future negotiations, "if any," would only take place after "an explicit consensus decision is taken among WTO Members."[203]

The Singapore Declaration also endorsed the Information Technology Agreement ("ITA"), another key U.S. initiative which served an industry that was a key Clinton constituency and a source of millions of U.S. jobs. During the Uruguay Round, U.S. industry had pushed strongly for "zero-for-zero" tariff elimination in many areas of U.S. strength, including automatic data processing equipment and parts, semiconductors, and other high-technology products. The Uruguay Round implementing legislation provided residual tariff cutting authority to continue tariff elimination in these sectors. In 1995, the Trans-Atlantic Business Dialogue endorsed the concept of continuing tariff elimination in this sector. The next step for U.S. negotiators was to recruit the Quad countries, then obtain the endorsement of APEC in 1996. The ITA then became a major "deliverable" for the Singapore Ministerial Meeting on December 1996, which established a WTO work program for completing the technical arrangements for the ITA. At Singapore, 28 countries committed to the ITA, and others joined later. At present, the ITA covers countries responsible for over 95 percent of world trade in ITA products, including China.

The next Ministerial Meeting took place in Geneva, in May 1998, to celebrate the Fiftieth Anniversary of the GATT. The Geneva meeting was largely celebratory, marked by the WTO's first violent demonstrations and a speech by President Clinton which invited the WTO to hold its next ministerial meeting in the United States. Otherwise, the Ministers agreed to a moratorium on duties on electronic goods and launched a study program on e-commerce. During the next year and a half, Seattle was chosen as the host city, the WTO went through a wrenching and divisive contest for the next Director-General, and the WTO worked in Geneva on preparations for Seattle–where the launching of a new round of trade negotiations would be the major issue for decision.

In the pre-Seattle preparations, developing country opposition to a new round surfaced with the tabling of many "implementation" proposals focused on rebalancing the WTO rules. By the time of the Seattle meeting, a full-blown confrontation had developed between the Cairns Group, insisting on a commitment that the new round would result in elimination of agricultural export subsidies, and the EC, refusing to agree to any such commitment up front. The EC and Japan pressed forward to get negotiations on trade and investment, and trade and competition, added to the negotiating agenda; developing countries pushed back. Asian exporters and others sought further negotiations on disciplines for trade remedies, and the Clinton Administration, pressed by the Democratic Party's labor constituency, sought a working group on trade and labor. The many weeks of discussions in Geneva did not produce resolution on any of the outstanding issues before the ministerial meeting began. The Seattle meeting collapsed spectacularly. The days of street demonstrations, paralyzing the meeting, became the headline that would be remembered, but the meeting would have failed for a number of reasons even without the demonstrations.[204] The launch of a new round would have to await a new President, a new USTR and a different political environment.

VIII. A New Round again, and the Trade Act of 2002

A. The Launch at Doha

Two years later, in November 2001 at Doha, the gavel finally came down on a ministerial declaration launching a new round. The setting had shifted from 1999's high-growth high-tech Seattle, to a cooling world economy, developing country demands, and the shadow of September 11. Changes of administration on both sides of the Atlantic had brought a new USTR, Robert Zoellick, and a new EC Commissioner for trade matters, Pascal Lamy, who had worked closely together during the first Bush Administration. Yet as Zoellick and his team at USTR approached the Doha Ministerial, their objectives had a great deal of continuity with U.S. objectives in 1999 and before; U.S. fundamental economic interests remained unchanged.

The U.S. agenda going into the Ministerial was both positive and negative. U.S. agricultural exporters wanted ambitious negotiations that would open markets. The EC wanted the new negotiations not to be tied to elimination of agricultural export subsidies, and as before sought negotiations on protection of appellations of origin for distinctive European products. The EC also pursued WTO negotiations on environment as a must-have, in spite of widespread opposition in the WTO.[205] U.S. food industry groups and their Congressional supporters opposed providing any opportunity for the EC to table proposals on environment that would authorize new market access barriers through food labeling, or introduce the "precautionary principle" into trade agreements to attempt to justify trade-restricting EC regulations based on uncertain science.[206]

The U.S. business community wanted negotiations on market access for services and non-agricultural goods that would open markets both in developed and developing countries, on a timetable responsive to business needs.[207] Congressional interests active on antidumping in 1994, spurred by a string of unfavorable WTO panel decisions on trade remedy cases, opposed any WTO negotiations on antidumping and subsidies, or insisted that negotiations strengthen the effectiveness of the WTO Agreement in fighting dumping. Going into Doha, the United States waged an isolated battle to keep antidumping and subsidies off the negotiating agenda entirely.[208] As for the four "Singapore issues," historically, the only Singapore issue on which the United States had been active was transparency in government procurement, promoted by both business groups and anti-corruption NGOs.[209] U.S. skepticism about WTO investment and competition negotiations had only increased since Singapore. The U.S. business community, mindful of the existing network of bilateral investment treaties, insisted that any WTO investment

[205] *Lamy Says EU Must Have Ability to Negotiate Environment in WTO*, INSIDE U.S. TRADE (Nov. 9, 2001). The EC's interest in environment stemmed in part from the presence of Green parties in governing coalitions in a number of European countries including Germany.

talks must pursue high standards and elimination of any barriers to investment.[210] India, Malaysia and others in the developing world opposed the investment and competition initiatives in 2001 as strongly as ever.

In the end, at Doha developing countries took and held center stage for the first time in the WTO. In addition to the Doha Declaration launching the new round,[211] the Ministers at Doha adopted a Decision on Implementation-Related Issues and Concerns,[212] a mechanism for extending the phaseout of export subsidies by developing countries,[213] and a declaration recognizing the flexibility and scope of TRIPS provisions on compulsory licensing of patents in connection with public health crises, such as AIDS.[214] The final text of the Doha Declaration provisions on market access negotiations envisaged full participation in the benefits by developing countries and authorized them to provide less than full reciprocity in market access.[215] Immediately after the ministerial meeting, WTO Director-General Moore dubbed the round the Doha Development Agenda.

The declaration provided the charter for a new round of negotiations as a single undertaking, including core market access areas such as agriculture, services and market access for non-agricultural products. The declaration's provisions on agriculture came to rest at the compromise formula "reductions of, with a view to phasing out, all forms of export subsidies,"[216] allowing all sides to claim victory. In return, Ambassador Zoellick helped Commissioner Lamy to obtain a negotiating mandate for at least a few environmental issues,[217] after Lamy provided a letter promising that the EC would not use the negotiations to alter the balance of WTO rights and obligations on the "precautionary principle," or to justify illegitimate trade barriers under current or future biosafety agreements.[218] After much resistance by the United States, the single undertaking also included talks on clarifying and improving disciplines under WTO rules, including antidumping, subsidies and regional trade agreements.[219] Renewed negotiations on dispute settlement rules were also thrown into the mix, although outside the scope of the single undertaking.

The outcome at Doha on the Singapore issues was more ambiguous. On all four Singapore issues, the Declaration provided that negotiations would take place after the Fifth (Cancun) Ministerial "on the basis of a decision to be taken, by explicit consensus, at that session on modalities of negotiations"—echoing the Singapore Declaration. The

declaration also set agendas for interim work, designed to clarify the limitations on the future negotiations and on any resulting agreement. The strategy of deferring the decision for two years had emerged in the pre-Doha process, moderated by General Council Chairman Stuart Harbinson, whose skill was a major factor in the success at Doha. But at the insistence of India, just before adoption of the Ministerial Declaration the meeting chair, Yussef Hussain Kamal, made a statement noting that some delegations had requested a clarification of its references to "explicit consensus." He noted that:

> "it was his understanding that a decision would indeed need to be taken by explicit consensus before negotiations on [any of the four Singapore issues] could proceed. In his view, this would also give each Member the right to take a position on modalities that would prevent negotiations from proceeding after the Fifth Session until that Member was prepared to join in an explicit consensus."[220]

After the meeting, the EC claimed that in spite of this personal statement, the Ministerial Declaration still committed the WTO to a postponed launch of negotiations on these issues.[221] Three weeks later, governments' interpretations of the Doha texts were so divided that it was still not clear what exactly the Ministers had agreed to.[222] The consequences of this ambiguity would be seen two years later in the impasse and failure of the Fifth Ministerial Meeting in Cancún.

While the Doha Ministerial succeeded in launching the Round, it left critical issues unresolved. The overall deadline of January 1, 2005 for concluding negotiations was clear. Within this envelope, Ministers set a deadline of June 30, 2002 for tabling of requests for commitments in services. The next major deadline was March 31, 2003 for both services offers and agreement on modalities for further commitments in agriculture. May 2003 was the deadline for concluding negotiations on amending the WTO's Dispute Settlement Understanding. By the Fifth Ministerial, in Cancún, participants were to submit comprehensive draft schedules of agricultural trade commitments, and were to decide by "explicit consensus" when (and according to some, whether) to launch negotiations on the Singapore issues.

B. Trade Promotion Authority: the Trade Act of 2002

Even before his confirmation as U.S. Trade Representative, Robert Zoellick started campaigning for Congressional approval for fast-track authority to negotiate trade agreements—which he renamed "trade promotion authority." Yet the issues that had blocked fast-track since 1994 still remained: the deep split between Democrats seeking, and Republicans opposing, provisions that would require that any agreements opening trade had to include binding, enforceable rules on environment and labor.[223] By the end of 2002, the Administration had achieved its goal of a broad grant of trade promotion authority, although by the narrowest of margins in the House, as part of a general movement toward a more partisan Congressional policy process, and with a boost from a budget-busting farm bill and a Presidential grant of import relief for steel. The final fast-track package also took on a new agenda of concerns about foreign challenges to U.S. legislation.

[223] *Zoellick Pushes for Prompt Revival of Fast-Track Authority*, CQ WEEKLY (Feb. 3, 2001) at 295.

The partisan note was struck in September 2001, when House Ways and Means Chairman Bill Thomas introduced a fast-track bill that was described as a bipartisan compromise, but immediately denounced by Ways and Means Democrats.[224] In October, the Ways and Means Committee reported out a bill with few concessions to the Democratic minority's substantive agenda.[225] The opposition was led by "New Democrats," normally pro-trade, who raised concerns about the effect on U.S. legislation of WTO negotiations on non-tariff barriers. The Republican leadership focused on persuading wavering Republicans from import-sensitive districts. On December 6, the day of the House vote, Rep. Jim DeMint put the bill over the top in return for a letter from the leadership promising to limit Caribbean trade preferences for textiles. The bill passed 215–214, with only 21 Democrats voting in favor.[226]

The Senate Finance Committee quickly approved a bipartisan bill in December, but the proposal then stalled until 2002 over a dispute on safety-net benefits. The House bill had reauthorized the existing program of trade adjustment assistance for workers displaced by trade agreements; Senate Democrats, led by Finance Committee Chairman Max Baucus, insisted on a major expansion of trade adjustment assistance including health care benefits. On May 23, 2002, the Senate passed a fast-track bill with the expanded benefits, including the Dayton-Craig floor amendment which would permit Congress to exclude from fast-track any agreement altering U.S. trade remedy laws.[227] After a short conference, Baucus and Thomas resolved the final details in a three-hour closed-door session on July 25. After more lobbying, the House passed the conference report July 27 by 215–212, the Senate approved it 64–34, and the President signed and approved it on August 6.[228]

The final bill, the Trade Act of 2002, set an ambitious negotiating agenda for the United States. It provided authority to negotiate, and provided fast-track treatment for implementing bills, for the Doha Round, the future Free Trade Area of the Americas, the free trade agreements with Chile and Singapore, and other, future bilateral free trade agreements. The initial grant of authority for non-tariff agreements, including both WTO-based agreements and free trade agreements, applies only to agreements entered into before June 1, 2005, which make progress in meeting the Act's stated negotiating objectives.[229]

The Act specifies a series of procedural conditions that must be met in order for fast-track treatment to be accorded to a trade agreement implementing bill. The President must notify in advance his intention to initiate negotiations[230] and must consult with Congressional trade committees, committees of jurisdiction and a new Congressional Oversight Group.[231] Any proposals that could be in an agreement that would require changes to U.S. trade remedy laws must be reported to Congress at least six

months before the United States would enter into the agreement, and Congress may pass a non-binding resolution whether the proposals are consistent with the Act's negotiating objectives.[232] At least ninety days before the President enters into the agreement, he must notify Congress of his intention to do so.[233] Within sixty days after entering into the agreement, the President must submit to Congress a description of all changes to existing law required to bring the United States into compliance.[234] Finally, at some (unspecified) time after entering into the agreement, the President must submit a draft implementing bill, a statement of administrative action proposed to implement the agreement, and an explanation of how the agreement changes existing rules and how it meets U.S. negotiating objectives.[235] If all of these conditions are met, the implementing bill will receive fast-track, no-amendment treatment. The agreement may enter into force for the United States only after such a bill is enacted into law.[236]

The negotiating objectives in the bill reflect the shift in the U.S. economy and in political concerns since the days of the GATT. The objectives, which apply for all agreements negotiated thereunder, call for market access in goods and services,[237] strong protection for intellectual property rights,[238] and strong protection for investment, including meaningful procedures for resolving investment disputes.[239] Additional objectives include fighting corruption and enhancing transparency,[240] ensuring open trade conditions for e-commerce,[241] and fighting regulatory protectionism and trade barriers that arise from regulatory dissonance.[242] Detailed agriculture objectives call for tariff cuts, subsidy reduction or elimination, and fighting state trading, with an emphasis on biotechnology, ending unjustified barriers not based on sound science, and providing adjustment periods for import-sensitive agriculture.[243] On labor and the environment, the stated negotiating objectives include ensuring that a party to a trade agreement does not fail to effectively enforce its *own* environmental or labor laws in a manner affecting bilateral trade, in a sustained manner; and recognizing that parties to a trade agreement have rights to exercise discretion over their enforcement decisions, and that no retaliation may be authorized based on exercise of these rights, or the right to set domestic labor and environmental

[243] *Id.* §2102(b)(10).

standards.[244] The act also sets objectives to protect the ability to enforce trade remedy laws and to reform border tax rules.[245]

The provisions on dispute settlement in the Trade Act of 2002 reflect Congress's perception of how WTO dispute settlement has affected the United States, and set an agenda for the United States in negotiations on dispute settlement rules. One of the three overarching Congressional findings provided as a basis for the Act is that "[s]upport for continued trade expansion requires that dispute settlement procedures under international trade agreements not add to or diminish the rights and obligations provided in such agreements."[246] The Act required the Secretary of Commerce to report to Congress by the end of 2002, setting out a strategy to address Congressional concerns that WTO dispute settlement has altered WTO rules.[247] The negotiating objectives in the dispute settlement area focus both on dispute settlement and on enforcement. They call for enhancing compliance, for adherence by WTO panels and the Appellate Body to the standard of review, for more settlement of disputes through consultations, and for new remedies: trade-expanding compensation, or alternative penalties that avoid damaging bystanders to a dispute.[248] Within a year after a penalty or remedy is imposed by the United States as permitted by any new trade agreement, the President must report to Congress on how effective the penalty or remedy actually was in enforcing U.S. rights.[249]

The Trade Act of 2002 represented a victory for the Bush Administration, USTR Zoellick and the Republican leadership in achieving renewal of fast-track. The bill provided a clear negotiating mandate on trade issues, moving away from the anti-globalization mood and the dominance of concerns on labor and environment that had stymied proposals during the 1990s. But, as observers noted at the time, it came at the cost of some erosion of bipartisanship on trade issues.[250]

[244] *Id.* §2102(b)(11). This formulation reflects the criticism raised by Sen. Gramm and others that trade sanctions for insufficient protection of labor and environment would potentially subject U.S. laws to sanctions. The legislation also calls for capacity-building and greater cooperation between the WTO and the ILO. It also requires the executive branch to seek consultative mechanisms to strengthen respect for core labor standards and compliance with prohibition of the worst forms of child labor; to conduct environmental reviews of future trade and investment agreements; to review the labor impact of future trade agreements; to submit labor rights reports to the trade committees on each negotiating partner; to report on the extent to which each prospective trade agreement partner has laws governing exploitative child labor. §2101(c).

[245] *Id.* §2102(b)(14)–(15). The border tax objective, like similar mandates in earlier legislation, responds to the tax issues underlying the GATT and WTO disputes on the U.S. DISC and FSC tax legislation.

[246] *Id.* §2101(b)(3). The concrete focus of this statement is WTO panel and Appellate Body decisions "to impose obligations and restrictions on the use of antidumping, countervailing, and safeguard measures by WTO members" and application of the standard of review in Article 17.6 of the Antidumping Agreement. *Id.*

[247] *Id.* §2105(b)(3), providing also that fast-track procedures would not apply to any agreement negotiated under WTO auspices if this strategy was not submitted on time. The report to Congress provided a snapshot of U.S. experience with WTO dispute settlement, expresses concern about cases involving U.S. trade remedies, and proposed an executive branch strategy in two parts, led by negotiation in the Doha Round talks. An appendix to the report attached a U.S.-Chile proposal tabled in the Doha Development Agenda negotiations on dispute settlement, suggesting changes to the DSU with the stated objectives of providing greater Member control over the dispute settlement process and greater flexibility to settle disputes. *Executive Branch Strategy Regarding WTO Panels and the Appellate Body*, Report to the Congress Transmitted by the Secretary of Commerce, Dec. 30, 2002, text at http://www.ita.doc.gov/FinalDec31ReportCorrected.pdf.

[248] *Id*. §2102(b)(12). These objectives also call for principal negotiating objectives (e.g., environment and labor objectives as well) to be treated equally in trade agreement dispute settlement procedures and remedies.

[249] *Id*. §2101(c)(11) (apparently reflecting, *inter alia*, dissatisfaction with the *Hormones* case outcome).

[250] Destler, *supra* note, at 16.

The trade issues in the bill reflect the trade issues that matter now to U.S. domestic interests, in an economy increasingly based on services and high-value-added manufacturing, and with an agricultural sector that speaks strongly through the Senate. At the same time, the Act signals Congress' abiding concern with U.S. trade remedy laws. But as I.M. Destler observes:

> [d]evotion to the unfair trade laws has been an important means by which lawmakers have covered or balanced support for mainstream trade liberalization policies. Nor has the pressure of steel and other users of these laws been effectively countered by import-using industries hurt when [antidumping] duties drive input prices up, or export industries hit with the application of mirror-image legislation overseas. But it may become increasingly difficult for the United States to hold to these laws *and* negotiate broad global trade agreements. Members of Congress may have to choose.[251]

Zoellick and USTR immediately took up the challenge, quickly completing negotiations on free trade agreements with Chile and Singapore, and dangling the possibility of additional FTAs in a strategy of "competitive liberalization." The FTAs demonstrated that the WTO was not the only game in town. For services in particular, the FTAs produced new market access, where WTO commitments have largely stopped at legally binding the existing level of trade liberalization. The FTAs also go beyond the WTO, embracing emerging subjects such as labor rights, anti-corruption and trade facilitation, and incorporating investment chapters with a quality of commitments that could never be expected in the WTO.

Yet FTAs have their drawbacks too. Politics and foreign policy tend to dominate when most countries pick their FTA partners. The United States will not enter into an FTA with New Zealand, for instance, because of foreign policy differences.[252] But after the political winds blow in another direction, economic fundamentals will always remain as the bedrock of a sustainable trade policy. It is economics, not foreign policy, that will get business interests to push for Congressional approval of a controversial FTA. FTAs can also be a costly use of negotiating resources and the resources of the business community, and they demand that both business and government maintain a consistent policy line from agreement to agreement. And for some issues such as agriculture, there is no substitute for multilateral negotiations in the WTO—as the November 2003 meeting in Miami of Trade Ministers from the Americas was to demonstrate.

C. And Then Cancún

The core issues for the negotiations launched at Doha concern market access—tariff cuts on agricultural and industrial products, market access commitments for trade in services, and commitments on agricultural subsidies that are individual to each WTO Member. Earlier trade rounds show that market access results tend to come together quickly just before the final deadline, but not until then. But these negotiations will not start until there is agreement on how these negotiations will take place, and on what their objectives are to be. The Doha Ministerial Declaration only determined that negotiations would take place, and postponed decisions on these "modalities" until specified dates in 2003.

In the two years after Doha, delegations tabled proposals on tariff negotiating formulas, frameworks for subsidy reduction, and frameworks for services trade liberalization. The

United States tabled ambitious market access proposals: a comprehensive proposal on agricultural trade reform,[253] elimination of tariffs on non-agricultural goods by 2015,[254] and requests and offers in the services market access negotiations. But as this work progressed, gaps began to appear between various WTO Members in their level of ambition for the negotiations. Every one of the deadlines set for agreement on modalities was missed. Since all of the negotiations are tied as a single undertaking, and progress in some areas is linked to others, all of the negotiations were not moving forward.

The chairmen of the negotiations on agriculture and on non-agricultural market access continued to consult with delegations on compromise texts regarding modalities, but in early July, Stuart Harbinson, the agriculture chair, reported that agreement on modalities remained elusive.[255] By late July, as the WTO General Council chair unveiled the first draft of a ministerial declaration, U.S. and EC officials were already working to lower expectations for Cancún,[256] and at a mini-ministerial in Montreal, trade ministers asked U.S. Ambassador Zoellick and EU Commissioner Lamy to present a joint text on agriculture modalities by mid-August.[257] On August 13, they tabled a joint framework paper, described by Ambassador Zoellick as an effort to translate the EC's CAP reform of June 2003 into the context of the WTO negotiations. Although the paper was widely criticized, negotiations in Geneva began to take off, with tabling of a new draft ministerial declaration for Cancún. The U.S.-EC paper also sparked formation of the G-21 group of 20-plus developing countries, led by Brazil, India and China, who developed their own text and moved the ministerial draft back toward the original U.S. position. A group of poor West African countries pursued their own proposal on elimination of subsidies to cotton, targeted in particular at subsidies under the U.S. 2002 farm bill.[258] Meanwhile, on August 30, clearing away another piece of unfinished business, the WTO General Council adopted a waiver decision facilitating wider access to medicines for AIDs, tuberculosis, malaria and other epidemics in developing countries.[259]

At Cancún, for the first time in the GATT or WTO, a breakdown in negotiations was not caused by agriculture—unlike the breakdowns at Seattle, Brussels or Montreal. Instead, negotiations broke down over the Singapore issues, advanced by Europe and Japan against the adamant resistance of India, Malaysia and other developing countries. After Commissioner Lamy agreed to give up on including negotiations on investment or competition policy in the single undertaking on September 14, Japan followed suit on investment. At a "green room" informal negotiating meeting held that afternoon by Mexican Foreign Minister Luis Ernesto Derbez, African and other developing countries,

unable to achieve a rapid change in position, refused to agree on a compromise launching negotiations only on trade facilitation. Minister Derbez then acknowledged the impasse, and decided to end the conference at that point.[260]

IX. The WTO in 2005: Challenges ahead

Almost a year later, on August 1, 2004, the Round returned to life when the General Council agreed on a framework for negotiations moving forward.[261] The framework definitively launched negotiations on trade facilitation as part of the single undertaking, but also definitively determined that no further work toward negotiations on investment, competition or transparency in government procurement would take place within the WTO during the Doha Round. The center of gravity in the Round thus shifted to the basic market access issues that have always sustained trade negotiations, and to rulemaking efforts closely linked to market access.

The August decision also set the next big deadline, deciding that the next Ministerial Meeting will be held in Hong Kong in December 2005. And the General Council agreed to "continue the negotiations launched at Doha beyond the timeframe" set out in the Doha Declaration, to an unspecified date after January 1, 2005.

As in past rounds, the real deadline for conclusion is likely to be set by the expiration of U.S. fast-track (trade promotion) authority, provided in the Trade Act of 2002. The Trade Act permits extension of fast-track authority for agreements entered into before June 1, 2007. To make it happen, the President must submit a report to Congress by March 1, 2005. The report must contain a request for extension, a description of all agreements negotiated so far under fast-track authority, a description of progress made toward achieving the negotiating objectives set in the Act, a statement that this progress justifies the continuation of negotiations, and a statement of the reasons why the extension is needed. By May 1, 2005, Congress must also receive independent advisory reports from the CEO-level Advisory Committee for Trade Policy and Negotiations, and the U.S. International Trade Commission. Fast-track authority is then extended to 2007 unless either House adopts an extension disapproval resolution by June 1, 2005.[262]

Much hard work will be necessary, in Geneva and in capitals, if negotiators are to meet even the 2007 deadline. The path to the end of the Round will be beset by challenges. The first challenge is rebuilding the U.S.-EC relationship, which—as demonstrated in August 2003—is the motor that will start the Round moving forward again. The Zoellick-Lamy relationship has created much of the momentum since 2001, and Peter Mandelson and his U.S. counterparts will need to find a comparable basis for collaboration. Business on both sides of the Atlantic has a stake in seeing that this collaboration bears fruit. Once these bridges are rebuilt, the developed country *demandeurs* for the Round can reach out to Brazil, India, China and other major emerging powers in the WTO, whose collaboration was essential to the relaunch of the Doha Round in 2004.

[260] *Cancun Ministerial Collapses Over Singapore Issues*, INSIDE U.S. TRADE (Sept. 15, 2003).

[261] The discussion of the WTO in this section is indebted to the insights and analysis of John Weekes of Sidley Austin Brown & Wood, former Ambassador of Canada to the WTO. Any errors are the authors' alone.

[262] Trade Act of 2002, *supra* note 229, §2103(b)(1)(C), §2103(c). These provisions are closely similar to the fast-track extension provisions in the 1988 Omnibus Trade Bill, which were used to extend fast-track authority in 1991 after the failed Brussels Ministerial. Before submitting the report to Congress that requested that extension, USTR Carla Hills achieved agreement from the EC on the point where the Brussels negotiations broke down, that negotiations would deal with all three aspects of agriculture, including export subsidies; *see* text at note above.

The extension process sets March 2005 as the deadline for the U.S. Administration to demonstrate to Congress that it has made concrete progress in the Doha negotiations. By spring 2005, there will be a renewed or new Administration in Washington, a new EC Commission, and new players in other governments and in Geneva. Rather than spend the rest of 2004 marking time, negotiators can work on creating the basis for an agreement with a high level of ambition. The U.S. exporting business community, whose support will be essential to achieving Congressional approval for the Doha Round results, has underlined at every opportunity its interest in such an agreement, and has, for instance, united to resist attempts to lower the level of ambition for the FTAA.[263] The next two years will be crucial for building the right basis for the DDA to realize its full potential to expand trade, re-energize the world economy and lift with it the economies of developing country exporters. The work of business and negotiating governments in the year to come will make all the difference to that result.

* At the time of writing (May 2003) the author was serving as Deputy Chief of Mission at the New Zealand Embassy to the United States in Washington, D.C. The views expressed in this chapter are those of the author and should not be taken as reflecting the views of the New Zealand Embassy to the United States, the New Zealand Ministry of Foreign Affairs and Trade or the New Zealand Government.

I. Introduction

In Chapter 76 of this book it was noted that the stated objective of New Zealand's trade policy is multilateral free trade.[1] This is a rational economic strategy for a small open economy that lacks global pricing power or a domestic market of sufficient size to generate economies of scale for local producers. This chapter takes this objective as its starting point and examines what that would mean in practice for the outcome of the Doha Round. It is not suggested that these outcomes are actually being pursued by New Zealand either in the Doha Round or in any other trade negotiation. Stated New Zealand negotiating objectives are referenced, as relevant.

In considering what free trade would imply for the negotiations, it is perhaps important to set out what it would not mean, in order to dispel the populist misperceptions that all too frequently seem to be associated with the term. Free trade certainly would not mean trade without rules—complete open slather without any government involvement whatsoever. To function effectively and efficiently "free" markets require a variety of legal support structures. Some, such as medium of exchange and mechanisms for redress of breach of contract, are designed to lower transactions costs. Others, such as market regulation and competition law are designed to deal with situations where markets can fail to deliver socially desirable outcomes. Trade, which simply connects markets across nation-state borders, is no different.

So what would free trade mean? The dictionary defines "free" as "released or exempt from, not subject to tax, duty, trade-restrictions, or fees".[2] The remainder of this Chapter considers what this concept would imply for various aspects of the Doha Round negotiating agenda.

II. Market Access

At the core of the "Doha Development Agenda" ("DDA") is a market access agenda covering three pillars: comprehensive coverage of the goods economy divided into agricultural and non-agricultural products; and, as a result of the expansion of scope of the multilateral trading system established during the Uruguay Round, the services economy also. This section considers free trade negotiating objectives in respect of the traditional market access barrier – tariffs – across the goods economy as a whole; accompanying objectives in agriculture; and a possible free trade agenda for services negotiations.

A. Tariffs

For a start free trade must mean bound zero tariffs on all products, agricultural and non-agricultural. There are those who attempt to argue that any tariff in the range of zero to five percent should be considered to meet the definition of "free". That is like buying a product on-line or from a mail-order catalogue which is advertised as "free shipping and delivery" and then being charged a fee of say three percent on the value of the product when it arrives at the front door. There are not many purchasers who would accept that as being consistent with the meaning of the word "free".

[1] For a complete exposition of this policy, *see* New Zealand Ministry of Foreign Affairs and Trade, *New Zealand Trade Policy; Implementation and Directions: A Multi-Track Approach* (September 1993).
[2] CONCISE OXFORD DICTIONARY (7th Ed., 1982).

The fact that only forty percent of world trade is secured by zero bound tariffs illustrates that there is plenty of work to do in this Round on the traditional market access agenda to achieve free trade. While the pattern of tariff dispersion differs by country, globally and especially amongst the large developed countries, the highest tariffs are typically found in the agriculture and textiles clothing and footwear sectors.

New Zealand has in Geneva proposed the elimination of tariffs on all non-agricultural products,[3] as has the United States,[4] and would have no difficulty also eliminating tariffs on agricultural products as envisaged in the United States agriculture proposal of July 2002.[5]

How zero tariffs across the board are achieved is a matter of detail for any negotiating process. Attention in public debate on tariffs is frequently focussed on high tariffs or "tariff peaks". At the other end of the spectrum, however, many tariffs especially in OECD economies are already at low levels. While in and of itself a tariff of five percent or less is often economically insignificant, being potentially more than offset by productivity changes or modest currency swings, there are a range of costly bureaucratic procedures (such as valuation and rules of origin) surrounding such "nuisance tariffs" which mean that their elimination should also be a priority.

An overall timeframe would need to be established. One possible benchmark for this is the ten year outer envelope for achievement of liberalisation within an FTA under WTO rules.[6] On the basis of the 2005 deadline for conclusion of the Doha Round negotiations this would see tariffs eliminated by 2015. Within that overall timeframe "nuisance tariffs"—assuming they are defined as five percent or less—should be eliminated immediately, with any other tariff line then being eliminated one year after it reaches that level. Tariffs above the defined "nuisance" level would be progressively reduced according to a negotiated formula.

One possible formula, given an x year phase-out, would be to reduce to zero in x equal steps. While giving the appearance of steady adjustment, such a linear approach results in an increase in the percentage decline in residual protectionism over the implementation period with that percentage being maximised in the year of elimination. This should not be a problem with most tariffs. For instance linear reduction of an initial tariff of fifty percent would mean a terminal reduction of five percent, no more than is contemplated with the immediate elimination of "nuisance tariffs". But the higher the initial tariff, the larger the final adjustment; a factor which could complicate the politics of securing implementation.

Another approach, which would deal more aggressively with extremely high tariff peaks but would also allow relatively more time for their elimination, would be to require a halving of the rate each year with the nuisance rule to cut in to achieve final elimination.[7]

[3] A detailed proposal has yet to be submitted but New Zealand foreshadowed such a proposal at the meeting of the Negotiating Group on Non-agricultural Market Access held on November 3–4, 2002. Under the proposal all WTO members, other than Least Developed Members, would be required to bind all non-agricultural tariffs at zero by an agreed date. Extended timeframes could be provided for sensitive products and for Less Developed Members. Least Developed Members could participate on a voluntary basis.

[4] *See* TN/MA/W/18 of December 5, 2002.

[5] The United States (*see* www.fas.usda.gov/itp/wto.actual.htm) proposed that members agree to a specific date for the eventual elimination of all agricultural tariffs. In the interim, it has proposed that agricultural tariffs be reduced to a maximum of 25 percent within five years.

[6] *See* paragraph 3 of the Understanding on the Interpretation of Article XXIV of the General Agreement on Tariffs and Trade 1994.

[7] One of the highest tariff rates can be found in Japan: HS Chapter 04 "Dairy produce; bird's eggs; natural honey; edible products of animal origin, not elsewhere specified or included" sets a rate of 1,738.4 percent.

This type of approach front-loads the absolute size of adjustment. Larger absolute cuts, however, may be easier to implement at the start of an adjustment process when higher absolute tariff levels may not be binding on economic decisions at the margin. Moreover as the absolute size of the required annual reduction reduces, the adjustment process is eased over time and the political challenges of securing implementation are likely to diminish.

There are numerous other non-linear possibilities for phased reduction with one of the more commonly used techniques known as the "Swiss formula". The advantage of a formula is that it removes the negotiating complexity and potential back-loading associated with a request/offer process.

For domestic lobbies concerned about loss of protection, generally the more sensitive the product the higher the initial tariff level. This automatically means that such products will be afforded either longer phase-out, higher protection during the implementation period, or some combination of the two depending on the formula used. An end point of zero also avoids the need to apply different modalities across different sectors, although it does not prevent negotiators from agreeing on accelerated elimination in particular sectors. The liberalising effects of a formula approach can also be enhanced through use of specified "down-payments" and by basing reductions on applied rather than bound tariff rates.

While the United States has yet to specify its view on the timeframe for elimination of tariffs on agricultural products, it has built on New Zealand's floating of the concept of tariff elimination on non-agricultural products with a bold proposal that calls for elimination to be achieved by 2015. This proposal, announced on November 26, 2002 by U.S. Trade Representative Zoellick and U.S. Commerce Secretary Evans, incorporates a number of the factors suggested above, in particular the immediate elimination of nuisance tariffs and an aggressive implementation path that would see all tariffs at eight percent or less by 2010.[8]

B. Agriculture

The Uruguay Round made a good start in bringing agricultural trade within the rules of the multilateral trading system and in liberalising markets, but much remains to be done. After more than fifty years of negotiation under the GATT and its successor WTO, industrial tariffs now average 4.7 percent while agricultural tariffs average more than ten times that level. Moreover, this already high average masks some extremely high rates on particular products in particular markets. To note just a few examples, not necessarily including the highest rates: in the United States there is a 244 percent tariff on sugar and a 174 percent tariff on peanuts; in the EU the tariff on beef is 213 percent; wheat in Japan faces a 353 percent tariff; and the tax on butter into Canada is 360 percent.

In addition to these extreme tariffs, agricultural trade is beset by enormous subsidies, on both domestic production and exports. Over the past several years OECD governments paid on average more than US$300 billion in support to their farmers, an amount

(There are a number of tariff rates in other countries' schedules in the range of 500–1000 percent.) Assuming the fifty percent cut rule is applied at the beginning of each year of implementation the following transition illustration (the brackets show the year of implementation and tariff rate respectively, fractions are rounded upwards) shows it would take ten years to eliminate a tariff of this level: (1:870); (2:435); (3:218); (4:109); (5:55); (6:28); (7:14); (8:7); (9:4); (10:0).

[8] Details of the proposal together with accompanying explanatory material are available at www.ustr.gov/new/Zero_Tariff.htm.

equivalent to the GNP of all of sub-Saharan Africa and six times the total of official development assistance aid flows. This vast level of subsidisation totally distorts the operation of the market which, coupled with often prohibitive market access barriers, robs efficient farmers in the developing world and elsewhere of a proper return on their labour and investments. In the words of Nicholas Stern, chief economist at the World Bank, "this kind of protectionism as practiced by the wealthiest industrialised countries is simply indefensible".[9]

For economies such as New Zealand and its Cairns Group partners,[10] dependent on agricultural exports, further agricultural liberalisation is at the core of the Doha Round agenda. Indeed it is no exaggeration to say that there will not be a successful conclusion to the Doha Round without a substantial outcome on agriculture.

Export subsidies on agricultural products are clearly the most pernicious distortion in international markets. It is no accident that export subsidies are subject to the most severe subsidies discipline for non-agricultural products—prohibition—and have been for over forty years.[11] In contrast, export subsidies on agricultural products, as defined by the WTO Agriculture Agreement, averaged around US$7bn per year over the period 1995–98 with ninety percent of this amount granted by the EU.[12] Export subsidies allow a two-tier pricing regime to persist in granting countries. High cost producers in protected markets can produce to excess at the inflated prices which result from the restrictions imposed on imports and then dump the surplus on world markets financed by taxpayer subsidies. Eliminating export subsidies would remove such surpluses from world markets opening up market opportunities for efficient producers and lifting world prices closer to economic levels at the margin.

Eliminating agricultural export subsidies is the first step to put agricultural export trade on the same basis as non-agricultural products. Recognising that domestic subsidies can act to impede access to the market of the subsidiser and can be used to cross-subsidise exports, the WTO Agreement on Subsidies and Countervailing Measures (commonly known as the "Subsidies Agreement") also imposes significant discipline on domestic subsidies for non-agricultural products. The term of existence of the WTO Agriculture Agreement provides an exception for agricultural products from the multilateral disciplines of the Subsidies Agreement, such as they currently are, while the "peace clause" restrains the application of countervailing duties on subsidised agricultural products until its expiration at the end of 2003.[13]

Expiration of the "peace clause" potentially provides the possibility of countervailing relief for producers in importing countries but additional disciplines are required to deal with access-impeding aspects, both in the market of the subsidiser and in third country markets. The latter aspect could perhaps be most simply addressed through the reinstatement and application also to agriculture of paragraph 1 of Article 6 of the Subsidies Agreement which reversed the burden of proof for demonstration of serious

[13] The "peace clause" is the name commonly given to the "due restraint" provisions of Article 13 of the Agreement on Agriculture. *See* Article 1(f) for specification of its duration.

prejudice.[14] Given the difficulty associated with demonstration of serious prejudice, the requirement of a subsidising party to demonstrate its absence represented an effective cap on subsidisation at the five percent ad valorem level. Negotiators could productively go further to make this five percent cap explicit, perhaps with some carefully defined policy-related exceptions, while retaining countervail and serious prejudice actionability (without reversal of burden of proof) for subsidies below the five percent threshold.

The outcome of this approach would then be zero bound tariffs, prohibition on export subsidies and domestic subsidisation capped at five percent ad valorem across the goods economy as a whole. Apart from agriculture, given the expiration of textiles quotas in 2005 the transition to this free trade environment is intellectually simple even if politically difficult to negotiate. Under the current agriculture agreement, however, a complex web exists of minimum-access and country-specific tariff rate quotas, detailed rules on levels and types of domestic subsidisation and volume and expenditure caps on export subsidies. This complexity reflects the outcome of Uruguay Round efforts to start untangling the highly distorted nature of agricultural trade while respecting the acquired access rights of efficient producers where they had already managed to build up some pattern of trade.

For agricultural export subsidies the transition mechanism is relatively straightforward to envisage. As with non-agricultural tariffs the simplest approach would be a formula-based phase down, in this case expressed in volume and expenditure terms, with elimination as the defined end point within a specified period of time.[15]

On agricultural domestic subsidies the desirable transition path is less clear. The extent and nature of current subsidies probably requires continued application in some form of the detailed architecture in the Uruguay Round agriculture agreement but negotiated disciplines should be directed at enhancing the transition to the five percent ad valorem product specific cap described above.[16]

On tariffs, the phase-down formula for non-agricultural tariffs should be applied also to agricultural tariffs. As previously noted a "halving approach" affords a relatively longer phase-out for the highest tariff levels. In products where tariff-rate quotas exist, out-of-quota tariff rates remain at such high levels that acquired access rights need continued protection during this transition process. One way to achieve this would be simply to hold in-quota tariff rates constant until the out-of-quota rate falls to the in-quota rate. The quota distinction could then be abolished and the unified tariff phased down until elimination was achieved. Similarly for globally available minimum access tariff rate quotas. The

[14] Pursuant to Article 31 ("Provisional Application") of the Agreement on Subsidies and Countervailing Measures, the provisions of Article 6.1 of the Agreement have currently lapsed.

[15] Both the United States in its July 2002 proposal and the Cairns Group (*see* G/AG/NG/W/11 of June 16, 2000 and additional input of November 20, 2002 at www.cairnsgroup.org) have formally proposed the elimination of export subsidies, the principal difference being that the United States has proposed elimination over five years in equal increments while the Cairns Group proposes elimination for developed country members in three years with a fifty percent reduction in the first year of implementation, and in six years for developing country members.

[16] The United States, in its July 2002 proposal, has proposed a five percent cap on trade-distorting domestic support to be achieved within five years. This cap, however, would be averaged over the total value of agricultural production rather than being applied on a product-specific basis allowing for the continuation of higher support levels on particular products. The United States also proposed that a date be agreed for the eventual elimination of trade-distorting domestic support. The Cairns Group responded to that point in September 2002 (*see* document 7623 at www.cairnsgroup.org) proposing that such domestic support be eliminated within five years by developed countries and within nine years by developing countries.

transition dynamics, however, may also need to deal with the desire of exporting countries to see earlier phase-down of in-quota tariff rates and/or expansion of quotas, particularly in cases where out-of-quota rates remain prohibitive.[17]

C. Services

Having dealt thus far with the goods economy, the other part of a market access agenda to achieve free trade is services. The General Agreement on Trade in Services ("GATS"), which also resulted from the Uruguay Round, represents the first attempt to bring services trade under multilateral disciplines. While the Uruguay Round outcome on services exceeded the expectations of most negotiators, a huge agenda exists to flesh out the existing framework GATS and to extend the scope of bound specific commitments.

GATS country schedules contain commitments on both market access and national treatment. Recognising that many services require the co-location of producer and consumer, commitments on each are made according to four "modes" of possible supply: cross-border (the analogue to goods trade); consumption abroad (where the consumer travels to the "exporting" country where the service is produced, such as a tourist); commercial presence (where the supplier locates a juridical entity in the market of the "importing" country); and movement of natural persons (where an individual travels from the "exporting" country to provide services in the "importing" country).

Within a scheduled service sector or sub-sector this structure produces eight cells where commitments can be made: on each of the four modes with respect to both market access and national treatment separately. An "unbound" entry means no commitment is made in that cell. A partial commitment can be made in one of two ways. An "unbound except for . . . " entry means that a commitment exists only in respect of the measure itemised. The other type of entry is to schedule a limitation on a specific measure (for instance that only four operating licences are issued). This type of entry means that other than the specific measure listed, there are no limitations on the operation of service suppliers within the scope of that cell. A full commitment is shown as "no limitations". Sector specific commitments may also be subject to limitations which apply to all sectors and are listed in the horizontal section at the beginning of a Member's schedule.

Aside from Mode 4 (movement of natural persons), where further definition on what constitutes a service supplier may be required, the services analogue of zero-bound tariffs would be a schedule which contained no horizontal (general) limitations and "no limitations" entries in all cells across all specific sectors. A first step to achieve this would be to require the scheduling of binding commitments across all services sectors which reflect the current state of limitations on market access and national treatment in each WTO member. This would produce a negative list or "standstill" binding at the current state of openness. Negotiations would then establish the transition path to a full "no limitations" binding within a defined timeframe, potentially using formula approaches where applicable.

[17] The United States, in its July 2002 proposal, proposed that all TRQs be expanded by twenty percent with the in-quota tariff rate being eliminated over a five year period. In cases where the quota does not already represent a sizeable proportion of the market, this proposal would not result in a very significant increase in market access. In contrast the Cairns Group (*see* Job(02)112 of September 12, 2002 at www.cairnsgroup.org) has proposed that TRQs in developed countries be expanded by an amount equal to twenty percent of domestic consumption over a five year period with fifty percent of the total increase to be implemented in the first year. Developing countries would be required to expand access by fourteen percent of domestic consumption phased in over nine years. The Cairns Group too advocates the phased elimination of in-quota tariffs.

One services equivalent of the formula approach to tariff liberalisation in goods is that of the "model schedule". A model schedule for a particular service or service sector seeks to establish the pattern of commitments necessary to deliver effective market access for that service or sector. This can be a useful device for service suppliers in ensuring comparability in market access and national treatment conditions across different WTO member jurisdictions but care needs to be taken to avoid the "belts and braces" approach. The temptation to over specify is an understandable impulse which can occur when regulators and/or negotiators are seeking to secure a high degree of certainty in the commitments on offer. But the inclusion of redundant specificity can cast doubt on the extent of treatment afforded by more generally cast commitments where equivalent conditions, though unstated, ought to flow from a proper interpretation of associated GATS rules.

A similar situation can arise in respect of Article XVIII "Additional Commitments". These are commitments that members can register in their schedules on matters not covered under either the market access or national treatment elements of the commitments schedule. Essentially Article XVIII is designed to capture commitments on non-discriminatory aspects of domestic regulation as covered under GATS Article VI. Whereas Article VI takes a broad proscriptive approach, which as noted below is subject to ongoing negotiation, Article XVIII commitments follow a prescriptive approach which then limits regulatory flexibility to a subset of measures which would be permitted under Article VI. Again this can have the perverse effect of calling into question the value of more generally cast commitments that do not contain the degree of explicit specificity of those members following a formulaic Article XVIII approach. The use of Article XVIII in one sector can also lead to demands for similar regulatory harmonisation from other sectoral interests in sectors where such an approach may be neither necessary nor appropriate.

Another potential complication in negotiating services liberalisation is how to achieve an approach of progressive liberalisation within the construct of country schedules as described above. Unlike goods, there is usually no simple quantitative measure of protection such as the tariff. In some instances, a quantitative measure may exist. Thus in the case of the four operating licences measure noted above, a progressive move to say ten licences and then the removal of quantitative licensing altogether, would clearly be continually liberalising. But suppose, for instance, the initial scheduled limitation reflected only the existence of a monopsony purchaser. The introduction of limitations on the behaviour of service suppliers in conjunction with the removal of the monopsony restriction does not unambiguously square with the architecture of the member's schedule. In such situations the Article XXI "modification of schedules" procedure may provide a way to determine whether the proposed change represents an overall liberalisation in operating conditions for service suppliers. If not the procedure could be used to calculate what compensation needs to be provided, if the change is to be made, until such time as further regulatory changes do result in overall liberalisation.

On the GATS framework, negotiations are ongoing on subsidies, safeguards, government procurement and domestic regulation including professional qualifications. On domestic regulation the Technical Barriers to Trade Agreement for goods provides one potential negotiating benchmark which can be coupled with bilateral/plurilateral agreements on mutual recognition and conformity assessment of standards and qualifications. On subsidies, measurement issues aside, it is not clear why a similar architecture to that on goods—prohibition of export subsidies, five percent ad valorem cap on domestic

subsidisation with actionability within that—should not apply also in respect of services.[18]

Safeguards is more complex with respect to services both in terms of measurement and in respect of the type of relief that might be imposed, in particular in distinguishing between resident service suppliers on the basis of ownership. On government procurement the current plurilateral WTO Agreement on Government Procurement is partial at best and focussed on goods.[19] A free trade outcome requires a truly liberalising agreement across both goods and services which grants non-discriminatory market access and national treatment with the minimum procedural requirements necessary to ensure due process.

Two other outcomes are required to secure free trade in services. The first is the elimination of existing exemptions from the GATS non-discrimination (most favoured nation) obligation so that service suppliers are not favoured or discriminated against based on their country of origin. Under current GATS provisions this should be accomplished by the beginning of 2005,[20] but under a "free trade" outcome it is implied in any case as members are to fully bind their services sectors with across the board "no limitations" commitments. The second is to complete sectoral coverage through elimination of the current carve-out for aspects of the air transport sector. This would necessarily entail the registration of initial MFN exemptions to cover the range of existing bilateral/plurilateral preferences. Such preferences would then be phased out as non-discriminatory open access commitments are phased in within the prescribed overall timeframe.

III. Rules

Beyond this market access core the Doha Round also contains elements of various rules issues which can be seen as forming part of a free trade agenda. Some of these are "traditional" issues such as anti-dumping and subsidies and countervailing measures. Others are "new", including those identified at the Singapore WTO Ministerial meeting in 1996, the so-called "Singapore issues". Chief amongst these are trade and investment and trade and competition. The DDA specifies that negotiations on both of these issues will take place after the Fifth Ministerial Meeting (September 2003 in Cancun, Mexico) on the basis of specific decisions on negotiating modalities to be taken at the Ministerial. Negotiations are also specified on elements of the trade and environment agenda and on disciplines and procedures applying to regional trade agreements. Other issues, such as electronic commerce, are handled through on-going work programmes.

A. Anti-Dumping and Subsidies/Countervailing Measures[21]

The Uruguay Round made significant advances in these areas. The previous "Tokyo Round", completed in 1979, had resulted in plurilateral agreements that applied only to those GATT members that specifically signed on. The Uruguay Round negotiations

[18] Note the existence of disciplines on subsidies granted to service suppliers does not necessarily impede the granting of subsidies for provision of a service to nationals—such as education or health—which are available to service suppliers irrespective of source.

[19] *See* David J. Walker, *Government Procurement: A Small Open Economy Perspective*, in LAW AND POLICY IN PUBLIC PURCHASING: THE WTO AGREEMENT ON GOVERNMENT PROCUREMENT (Bernard M. Hoekman and Petros C. Mavroidis eds. 1997).

[20] *See* paragraph 6 of the Annex on Article II Exemptions, General Agreement on Trade in Services.

[21] *See* Chapters 11 and 16 of this book.

both improved substantive provisions and extended obligations to all WTO members. Considerable room for further improvement remains, however, for these agreements to complement a free trade agenda.

On subsidies a key focus of the Uruguay Round was to increase the multilateral disciplines on subsidies injurious to non-subsidised exporters in third markets—the other discipline on subsidising behaviour being the ability to countervail subsidies injurious to import-competing producers in the domestic market. As noted in Part II(B), one of the achievements in that respect, the reversal of the burden of proof contained in Article 6.1 of the Subsidies Agreement on the question of whether certain types of subsidies cause "serious prejudice" to another Member, has lapsed. Beyond simply restoring that provision, negotiators could usefully go further by adding the categories of subsidies enumerated in Article 6.1 to the category of prohibited subsidies under Article 3.[22] That would effectively limit any form of subsidisation to a maximum of five percent ad valorem. Further consideration could then be given to whether any additional forms of subsidisation within the five percent cap should be subject to enhanced disciplines under the effects-based tests of serious prejudice contained in Article 6.3.

Anti-dumping has long been an area of particular controversy in multilateral trade negotiations, and was one of the issues that threatened conclusion of the Uruguay Round. Historically this has reflected a sharp division of interests. At one pole are certain politically influential interests, particularly in the United States, concerned to retain the greatest flexibility possible in the ability to offset what is seen as artificial competition resulting from "unfair" trade practices. At the other pole are exporter interests concerned that resort to anti-dumping measures has become a tool of administrative protectionism as tariffs have been reduced.

In a free trade environment, where zero tariffs have already been achieved, the logical case for an anti-dumping remedy as it currently exists—as distinct from a remedy more rooted in competition policy—is not clear. CER, the bilateral free trade agreement between Australia and New Zealand, provides an example of this. Upon the achievement of free trade anti-dumping was replaced by a competition remedy. This provides each party with standing to bring a predatory pricing action in the other's jurisdiction. The change reflected the economic reality of the integrated market—in terms of the reduced scope for price discrimination—in a completely free bilateral trading environment. As such it may be applicable on a regional or multilateral basis once free trade is achieved in the respective context.

Pending the achievement of a zero-tariff environment, which as is noted in Section I may take a number of years, there are a range of steps which might be taken to guard against the potential for abuse of anti-dumping while still providing for mitigation of the effects of "unfair" competition. A number of these have been proposed in the current initial phase of negotiations. One suggestion is to transform Article 11.3 of the Anti-Dumping Agreement[23] into a true "sunset" provision by limiting all anti-dumping measures to a maximum of five years duration. Others seek to guard against upward bias in the calculation of dumping margins—the so-called "zeroing" issue, to avoid excessive remedy—the so-called "lesser duty" rule, and to make the demonstration of causation more robust. In respect of all these proposals it is interesting to note that the

[22] A proposal to this effect was submitted by the United States. *See Subsidies Disciplines Requiring Clarification and Improvement*, communication from the United States, TN/RL/W/78 of March 19, 2003.

[23] References are to the Agreement on Implementation of Article VI of the General Agreement on Tariffs and Trade 1994, commonly known as the "Anti-Dumping Agreement".

full implications of Article 11.1 of the Agreement—that "[a]n anti-dumping duty shall remain in force only as long as and to the extent necessary to counteract dumping which is causing injury"—seem to be little tested.

Such changes have always been perceived as being in the interests of exporters from certain developing countries and others, particularly in East Asia, long subject to numerous anti-dumping orders. In today's increasingly globalized economy this dichotomy of interest may not be so clear cut. It is not impossible, for instance, to envisage a situation where a firm owned by nationals of country A and located in country B petitions to seek an anti-dumping order against the imports of a firm located in County A but owned by nationals of country B. Since the foundation of the WTO statistics show less of a distinction between "users" and "defenders", and an increase in the number of countries resorting to anti-dumping measures, particularly amongst the larger developing countries.[24] When one reflects on these trends, and particularly the latter one, these improvements would also appear to be clearly in the interests of exporters from typically higher priced markets in the larger developed countries.

B. Trade and Investment

It is clear that the capacity to effectively participate in international trade is increasingly determined by access to foreign direct investment ("FDI") or other forms of linkages to transnational firms. It has been estimated that one-third of world exports of goods and services takes the form of intra-firm trade. As trends toward globalisation continue, distinctions between capital importers and capital exporters have become blurred and the role or place of foreign investment vis-a-vis what might previously have been defined as the "domestic economy" has changed.

WTO rules, particularly on goods, considerably lag this economic reality. On goods the rules resulting from the Uruguay Round, most notably the agreement on Trade Related Investment Measures ("TRIMs"), relate mainly to non-discrimination in the availability and/or use of domestic and imported products. In contrast, reflecting the way in which services are supplied, the GATS effectively contains a variety of investment-related provisions through the disciplines on commercial presence noted above. One approach to the inclusion of rules on investment more broadly would be to extend GATS Mode 3 type commitments to cover all goods sectors as well. This would provide commitments on non-discrimination, market access and national treatment for foreign direct investment and other forms of commercial presence by goods producers.[25] Such commitments might usefully be complemented by rules on investor protection. As with GATS, access for and operation of investments would be subject to the host government's right to regulate in support of legitimate domestic policy objectives, such as protection of the environment. Investor protection should be granted on a national treatment but non-preferential basis.

In addition any outcome on investment should also include disciplines on investment incentives. Such subsidies to investors can be seen as the equivalent of export subsidies on goods or services. Their purpose, to the extent they have any effect, is to

[24] *See* www.wto.org/english/res_e/booksp_e/anrep_e/anrep02_e.pdf for illustrative statistics contained in the WTO Annual Report 2002.

[25] "Commercial presence" as defined in GATS does not necessarily correspond with "investment" as typically defined. Ideally if the GATS-type rules/scheduling architecture was to be used, a common definition of covered investment should apply to both goods and services.

influence location decisions or in other words to secure a greater than equitable share of globally available capital than that which would pertain in their absence. Arguably, therefore, investment incentives—defined here as a financial or in-kind benefit granted to a foreign investor contingent on investing in the territory of the granting member—should be subject to the same discipline as export subsidies, prohibition. Note that this would not preclude the granting of regional development payments to both foreign and domestic investors alike on a national treatment basis, subject to such payments being consistent with the subsidies disciplines on the resulting goods and/or services produced.

C. Trade and Competition[26]

Competition appears to be the issue on which Doha Round negotiators have the most difficulty envisaging the appropriate role for the WTO. In some cases this may be related to states of development with a number of developing countries not yet having any domestic competition architecture. In other cases, particularly amongst the larger developed countries, the difficulties seem to revolve more around questions concerning the relationship between market definition and the borders of the domestic economy, and/or the appropriate bureaucratic division between respective arms of government.

The importance of the competitive process for economic welfare, as proxied by aggregate consumer and producer surplus, is a long-held tenet of the economic literature. Thus countries are increasingly introducing measures to safeguard the health of the process of competition, as opposed to the health of individual competitors. Looking within the confines of a domestic economy, while such measures are usually not cast in terms of enhancing the fortunes of a particular competitor, the ability of an individual firm to contest the market may rely on the prevention of anti-competitive behaviour by other market participants.

The process of trade liberalisation in moving to a "free trade" world as described above is about removing government-imposed barriers which act to prevent or frustrate the integration of markets across national boundaries. Thus trade liberalisation itself is a pro-competitive policy. As part of that process any government-mandated limitations on the number of competitors in an industry, including monopoly concessions, would be removed. But, just as in the domestic economy instance cited above, a foreign firm may need to rely on the prevention of anti-competitive behaviour by domestic incumbents to be able to contest the market.

This suggests the existence of a robust domestic competition policy/law framework coupled with a non-discriminatory enforcement regime is an important component of ensuring that effective market access opportunities exist in a "free trade" world. This framework would need, in each country, to be based on a core set of commonly agreed standards with failure to adequately implement/enforce such standards subject to the WTO's dispute settlement mechanism in individual cases.

In a "free trade" world the question of market definition would likely also increasingly arise as an issue between countries; in particular whether use of a market defined within a country's borders distorts the analysis or outcome in a competition action.[27] The longer

[26] *See* Chapter 57 of this book.

[27] *See, e.g.*, the difficulties that have arisen from differing determinations between the United States and the European Union in respect of mergers and acquisitions—the General Electric/Honeywell case being the most high profile example.

term question for negotiators to consider is whether this type of issue could be dealt with solely through mutual cooperation agreements between domestic competition authorities or whether some form of supranational authority may be required.

D. Trade and Environment[28]

Reflecting progress in deliberations on the interrelationship between trade and environment which have been undertaken in the Committee on Trade and Environment over the past ten years, the DDA also provides for negotiations covering specific aspects of that agenda.

It is well understood that trade liberalisation, through its contribution to economic growth and the globally efficient allocation of resources, is a key policy tool in promotion of sustainable development. Thus advancing the core market access agenda of the Doha Round together with the elimination/reduction of trade-distorting subsidies, particularly in resource-based industries such as agriculture and fisheries, will do much to advance environmental objectives.[29]

As a result of the past decade of international deliberations on the relationship between trade and environment, it is also widely understood that WTO rules and their associated exceptions provide broad scope for members to take measures in protection of their domestic environment.

It is also recognised that solutions to environmental problems which range beyond national borders or which relate to the global commons, require international cooperation. The DDA therefore includes negotiations on the relationship between WTO rules and specific trade obligations, as between parties to such agreements, contained in multilateral environmental agreements ("MEAs"). Ministers at Doha declared that these negotiations should ensure that such obligations can be implemented consistent with WTO rules while not compromising the WTO rights of members not party to the MEA in question.

The first part of this proposition reflects both legal and practical commonsense. Countries which have specifically agreed action amongst themselves in one international forum are not about to seek to undermine it in another. The implications of the second part of the proposition are less clear but, as with other areas of public policy it would seem appropriate that WTO rules provide for the taking of measures necessary to achieve the stated policy objective while guarding against disguised protectionism.

E. Non-discrimination

In Chapter 76 of this book it was argued that current WTO rules and procedures have been largely ineffective in acting as a check on the "arrangements of convenience" type of FTA that avoid liberalisation in sensitive sectors such as agriculture.

[28] *See* Chapter 58 of this book.

[29] Australia, Chile, Ecuador, Iceland, New Zealand, Peru, Philippines, and the United States in April 2002 (see *The Doha Mandate to Address Fisheries Subsidies: Issues*, TN/RL/W/3) jointly proposed enhanced disciplines on fish subsidies to deal with the current situation where subsidies of some US$14 bn to US$ 20 bn, which represent between 20 and 25 percent of the total value of global fisheries production and between 40 and 50 percent of the value of trade in fish, are both distorting trade flows and contributing to unsustainable harvest levels.

To remedy this, some have suggested that the "substantially all trade" test[30] should be defined as a percentage of existing trade between the countries concerned; 90 percent or 95 percent are variously mentioned. This type of measure, however, suffers from the weakness that the absence of existing trade may reflect the existence of barriers that are either prohibitive or chilling of trade in affected markets. Under such an interpretation, in the extreme case two countries with a mutual ban on trade (i.e., zero trade between them) could conclude a bilateral "FTA" that did not open up trade in any product and still meet the "substantially all trade" test.

Clearly this is nonsense. A more economically rational approach would focus on potential trade. By definition "trade" is simply the difference between domestic consumption and domestic production. That suggests any good or service that is produced or is producible in one of the countries and consumed in the other is potentially tradeable, with actual trade depending on relative prices. A more meaningful "substantially all trade" test would therefore focus on the sum of all these potentially tradeable products. To avoid a technically complex calculation, however, this could be proxied by the set of all tariff lines. Thus a test of say 95 percent of tariff lines could be combined with a similar threshold on existing trade with an agreement having to satisfy both criteria to pass the "substantially all trade" test.

In the current environment such enhancement to WTO rules on regional trade arrangements would be important to avoid continual undermining of the WTO's fundamental non-discrimination rule.[31] If, however, the Doha Round were to lead to the type of "free trade" environment envisaged earlier in this section, the simplest solution could be to grandparent existing FTAs with their inherent distortions being progressively eliminated during the transition period.

Meanwhile, pending any enhancement to existing rules and in the absence of a clear move to multilateral free trade, it remains to be seen whether any WTO Member will take advantage of the automaticity of the new dispute settlement system to formally challenge one of the more egregious examples of an agreement which arguably falls short of the "substantially all trade" test. There is also a question of whether refusal by a WTO Member, member of an FTA or customs' union, to enter into such an agreement with any other Member on substantially the same terms could be construed as inconsistent with the MFN requirements of GATT Article I.

While that scenario may be something of a stretch, that is not to say there are no remedies available under the WTO to a country that finds itself in such a situation. Take, for instance, the following example of three trading partners—countries A, B and C. Suppose Country A enters into an FTA with Country B and refuses to do so with Country C. Suppose too that the exports of countries B and C overlap to some degree and in those products they are competitors in the market of Country A. Given the resulting margin of preference opened up in favour of Country B, it is likely that import purchase decisions in Country A will be diverted away from the products of Country C and towards those of Country B.

[30] *See* GATT Article XXIV: 8(a)(i).

[31] The general "most favoured nation" tariff rate in a WTO member's tariff schedule has become something of a misnomer. In some cases the plethora of preferential rates, whether through FTAs, the Generalised System of Preferences ("GSP") or other preferential arrangements, has become so pervasive that countries facing the MFN rate are in reality the "least favoured" of nations. It has been estimated that nearly fifty percent of world trade is now conducted on better than MFN terms. *See generally* Chapters 5, 34 and 46 of this book. "Normal" or "standard" may be a more accurate term to apply to members' general tariff schedules where tariff rates are non-zero.

In such a scenario the benefits that accrued to Country C from the relevant bound MFN commitments of Country A are nullified or impaired by the trade differentiation introduced by Country A's FTA policy. While that policy may not be inconsistent with Country A's WTO obligations, Country C should be able to seek redress under the WTO's "non-violation" nullification or impairment provisions.[32]

If found against, Country A would not be required to remove the measure (i.e., revoke the FTA with Country B) but it would be required to compensate Country C for the nullification or impairment suffered. This would most logically take the form of similarly lowering market access barriers to Country C in areas where the products of Country B compete thereby eliminating any margin of preference. The net result would be that Country A's refusal to conclude an FTA with Country C has effectively required it to engage in a one-way market opening to certain of Country C's products. The expectation of such a result could do much to encourage the use of so-called "open accession" clauses in FTA policies thus enhancing the potential of bilateral/plurilateral liberalisation to contribute to the achievement of multilateral free trade.

F. Electronic Commerce

One of the most significant developments to affect international trade that has taken place since the Uruguay Round is the rise of the Internet and the associated opportunity for internet-based commercial transactions collectively known as "electronic commerce". Electronic commerce takes a myriad of forms but generally enables goods to be ordered remotely bypassing traditional distribution channels (an extension of the catalogue model with fulfilment being through some physical transport mode within or across borders) and goods and services which can be digitised to be supplied digitally. This latter aspect has considerably expanded the range of services for which cross-border supply, covered by Mode 1 of GATS, is feasible.

In this sense electronic commerce is primarily a new channel for distribution of goods and services rather than a distinct activity itself—although there are a number of elements which need to be in place to enable electronic commerce transactions to occur. It follows that there are no distinct negotiations on electronic commerce in the DDA. Legal and jurisdictional issues associated with matters such as taxation, liability and intellectual property protection continue to be debated in relevant international fora and in the WTO electronic commerce work programme.

In the absence of market access barriers implied by a free trade environment there would also be no barriers to the conduct of electronic commerce. Meanwhile in the current environment Members agreed, until the Fifth Ministerial Conference in Cancun, to "maintain their current practice of not imposing customs duties on electronic transmissions". To guard against the future imposition of protectionist measures this duty moratorium should be made permanent immediately, or at least extended pending the elimination of duties on other distribution channels.

IV. Institutional Issues—Dispute Settlement

The Uruguay Round resulted in major enhancements to the then existing GATT dispute settlement system. While significantly improved the WTO system, however, remains far

[32] *See* GATT Article XXIII:1(b) and Article 26.1 of the Understanding on Rules and Procedures Governing the Settlement of Disputes.

from perfect. As is evidenced most notably by several high profile cases between the United States and European Communities, procedural problems have been identified at the implementation stage of the dispute settlement process and questions have been raised about incentives for compliance.

There will always be a degree of asymmetry in any system which incorporates members of vastly different size and economic might. But for a rules-based system like the WTO to function sustainably, all members need to have confidence that the contract they enter into will be honoured or that they have the prospect of obtaining redress if it is not. That confidence underpins the "good faith" implementation by all members on which the system rests.

In the initial stages of the new dispute settlement system the omens were good. Cases were settled quickly, some even before running their full course through all stages of the system. More recently, as members have observed the lengthy timeframes inherent in full application of the system, and the difficulties associated with securing compliance, there seems to be an increasing tendency for members to implement measures of questionable WTO validity comfortable in the knowledge that a considerable temporal window of policy flexibility exists before their actions are called to account.

One possible solution to this lies in the nature of available remedies. Currently if a defending member does not bring a violating measure into compliance within the allowed "reasonable period of time",[33] the plaintiff can look to rebalance the contract through being offered equivalent compensation by the defending member or by retaliating against it through withdrawing an equivalent amount of concessions.[34]

Trade compensation is seldom an effective remedy because it is unlikely to provide sufficient offsetting advantage to the injured exporters in the plaintiff member. Note too that in a free trade environment no scope for trade compensation exists. Nor is retaliation attractive, if it actually has to be implemented, as raising trade barriers further damages the economy of the plaintiff and can injure unrelated third parties in the defending member.

Monetary penalties, in the form of fiscal transfer from the defending member to the plaintiff, could provide a more effective solution.[35] Monies received by the plaintiff government could be used to directly compensate the injured exporters. Moreover monetary penalties that either incorporated the notion of damages in addition to offsetting the degree of injury, or which escalated over time, could act to encourage timely compliance.

Even without a punitive element, however, moving to a monetary transfer system would make the costs of non-compliance far more explicit than under the current system. This would facilitate a more informed debate about compliance. If the "benefits" to the defending party of non-compliance are less than the visible cost of the monetary penalty, the likelihood of implementation should increase. Alternatively if a case arises where the benefits of non-compliance exceed the cost of the fine, the defending party could rationally decide to pay the fine. Given that the injured party in the plaintiff member is

[33] *See* Article 21.3 of the Understanding on Rules and Procedures Governing the Settlement of Disputes (commonly known as the Dispute Settlement Understanding) for definition of the "reasonable period of time".

[34] Article 22.1 of the Dispute Settlement Understanding makes it clear that the bringing of measures into conformity with WTO obligations is the preferred outcome to a dispute and that compensation or retaliation are temporary measures pending compliance.

[35] A monetary fine as an alternative to trade compensation or retaliation is included in the FTAs the United States has recently negotiated with Chile and Singapore.

receiving offsetting monetary compensation, even in this case aggregate welfare can be seen to have increased.

The current WTO dispute system is also based on estoppel, with remedies forward-looking from the time relevant rulings are made. A system of monetary penalties could also be made retroactive to the date a dispute was initiated. This could act to encourage a healthy degree of rigour in initial policy design and a heightened sense of timeliness in defending members' willingness to settle disputes. Even in the unusual case where it was welfare-enhancing for a member to pay the fine rather than bring its measure into compliance, a retroactive fine would minimise the loss suffered by injured exporters in the plaintiff member.

V. "Free Trade"—Putting "Development" in the Doha Development Agenda

Looking across the DDA the type of "free trade" outcome described in Parts II–IV is clearly accommodated within the Ministerial Declaration launching the negotiations, but it is not mandated by it in any of the negotiating areas. As noted above, the opening of markets and removal of trade distorting subsidies is key to the advancement of sustainable development. How far the negotiations get towards a free trade outcome will determine the degree to which the DDA really delivers an agenda for development.

The DDA correctly points to the need for technical assistance and capacity building, in conjunction with market liberalisation, to ensure that less developed members can take advantage of the economic opportunities that market opening provides. This is particularly the case in areas where changes in domestic regulatory frameworks and institutions are likely to be required. It is likely too that in some cases less developed economies could benefit from extended transition periods as economic adjustments are made in response to the removal of protection. What is important, however, is that the end point is the same. Differential standards (e.g., on border protection or subsidy levels), which allowed less developed countries to perpetuate the types of policy errors seen in developed economies, would not deliver the promise of sustainable development for all inherent in the DDA.

It is not suggested that free trade is a panacea for sustainable development; many other complementary policy initiatives at both the domestic and international levels are also required. But studies have consistently shown that countries which are more open to international trade grow faster than countries that are less open.[36]

Looking forward, the most recent World Bank study estimates that complete global trade liberalisation by 2015 could, over the ten years from 2005 to 2015, increase global income by $2800bn, with the majority of that going to developing countries.[37] That would lift a further 320m people out of poverty, fifty percent more than the baseline case. Compare the $1500bn net present value benefit for developing countries from trade liberalisation with the little more than $50bn in annual official development assistance aid flows and it is clear that protectionism is a luxury for some that the world can ill afford.

[36] *See, e.g.*, David Dollar, *Globalization, Inequality and Poverty Since 1980* in GLOBALISATION, GROWTH AND POVERTY: BUILDING AN INCLUSIVE WORLD ECONOMY (World Bank Policy Research Report December 2001); *see also* David Dollar and A. Kraay, *Growth is Good for the Poor*, World Bank Policy Department Working Paper No. 2587 (April 2001); and Jeffrey Sachs and A. M. Warner, *Economic Reform and the Process of Global Integration*, *Brookings Papers on Economic Activity* (1) (1995), at 1–118.

[37] World Bank, *Global Economic Prospects and the Developing Countries: Making Trade Work for the World's Poor* (2002).

President Bush correctly concluded that "open trade is not just an economic opportunity, it is a moral imperative."[38] The question is whether WTO members, individually and collectively, have the determination to respond to that imperative and realise the opportunity it offers.

* Distinguished Research Fellow, Centre for International Studies, University of Toronto.

I. Introduction

I have—not altogether successfully—tried to avoid using the word "globalization" because it has no agreed definition even though it first appeared in 1986. Instead I have chosen the term "deeper integration" to refer to the ongoing process of ever-tighter linkages among countries proceeding in stages since the end of World War II, first by trade negotiations beginning in the 1950s, then intensifying with the liberation of capital flows and deregulation of financial markets in the 1970s and 1980s. By the end of the 1980s a new phase of interdependence was launched by a marked increase in foreign direct investment, and the multinational enterprises ("MNEs") became the drivers of integration as they spread their production chains around the world. This third phase was and is closely linked to the revolution in information and communication technology and technological changes in transportation which made it cheaper and easier to manage far-flung production networks. With international rivalry intensifying, a wave of mergers and acquisitions has created an oligopoly of global giants in a number of sectors, as well as increasing flows of highly skilled and educated workers. Moreover, the emergence of E-commerce has, especially, but not only, in the service sectors, in effect, introduced a qualitatively different kind of integration which has been dubbed "fusion". In a world of fusion, which does not, of course, yet exist, the term national policy would be an oxymoron.

Someone (I do not remember who) once said, "give me a metaphor and I will change the world". Despite having no such ambition in my losing battle to avoid the word "globalization", I have become intrigued by the concept of an ever-widening and deepening global current, touching more and more distant shores and moving inland with increasing speed. Inevitably this powerful global current has evoked cries to erect barriers to stop the flooding, and even Canute-like clarion calls to turn back the tide. So this metaphor has provided the title of this Chapter: "Global Integration: Currents and Counter-Currents".

The deepening integration of the global economy is, in part, a "natural" phenomenon, fed and now led by technological changes driving in the direction of a single global market. But, of course, governments have played an important role, and international economic policy has facilitated—or perhaps even catalyzed—the deeper integration momentum. And the "natural" and "policy" forces are interrelated in a complex fashion which reflects the nature of the policy process. This process differs in different policy domains—for example trade versus financial or development policy. Yet it is important to underline that trade policy played a major catalytic role in fostering global integration.

This chapter begins with a brief sketch of the changes initiated by the last round of negotiations—the so-called Uruguay Round which began in 1986 and ended in 1994 with the creation of the WTO. The changes—mostly unintended—have introduced a profound transformation in the political economy of the policy process. This is, of course, a vast subject and I shall deal with only two aspects: the MNEs as drivers of the global current, and the new transnational actors—the NGOs (non-governmental organizations)—skillfully surfing on the counter-current. The last section will deal with the evolving change in the climate of ideas about the economy and society which heighten the uncertainty about the future of global integration and the nation state.

II. The Uruguay Round: Unintended Consequences

It could perhaps be plausibly argued that the unintended consequences of all significant government policies overwhelm the original policy objectives. The Uruguay Round is a particularly striking example of this dictum.

The Uruguay Round was the eighth negotiation under the auspices of the GATT (General Agreement on Tariffs and Trade), created in 1948 as part of the post-war international economic architecture. The primary mission of the GATT was to reduce or eliminate the border barriers which had been erected in the 1930s and contributed to the Great Depression and its disastrous consequences. The GATT reflected its origins in the postwar world in that it provided rules to buffer or interface between the *international* objective of sustained liberalization and the objectives of *domestic policy*, primarily full employment and the creation of the welfare state.

Before the Uruguay Round, the GATT worked very well. Tariffs and (to a lesser extent) non-tariff barriers were significantly reduced and trade grew faster than output as each fed the other. Since the 1960s trade rounds were essentially managed by the European Community and the United States though smaller countries were able to play a useful mediating role. The developing countries were largely ignored as players. Agriculture, the most contentious issue dividing Europe and the United States, was virtually excluded from negotiations so the transatlantic alliance, helped by the Cold War's constraint on trade frictions, was the effective manager of the international trading system.

The Uruguay Round was a watershed in the evolution of that system. For the first time agriculture was at the center of the negotiations and the European effort to block the launch of the negotiations to avoid coming to grips with their heavily subsidized and protected Common Agricultural Policy went on for half a decade. This foot-dragging also spawned a new single-interest coalition—the Australian-led Cairns Group, which included Southern countries from Latin America and Asia determined to ensure that liberalization of agricultural trade would not be relegated to the periphery by the Americans and the Europeans as it always had been in the past.

But the role of a group of developing countries, tagged the G10 hard-liners and led by Brazil and India, was in many ways even more important in the Uruguay Round's transformation of the system. The G10 were bitterly opposed to the inclusion of the so-called "new issues"—trade in services, intellectual property and investment—central to the American negotiating agenda.

Although the "new issues" are *not* identical—obviously negotiations on telecommunications or financial services differ from intellectual property rights—they do have one common or generic characteristic. Thus, they involve not the border barriers of the original GATT, but domestic regulatory and legal systems embedded in the institutional infrastructure of the economy. The degree of intrusiveness into domestic sovereignty bears little resemblance to the shallow integration of the GATT with its focus on border barriers and its buffers to safeguard domestic policy space. Thus, for example, the barriers to access for service providers stem from laws, administrative actions or regulations which impede cross-border trade and investment. Intellectual property negotiations covered not only comprehensive standards for domestic laws, but also detailed provisions for enforcement.

The inclusion of the new issues in the Uruguay Round was an American initiative, and this policy agenda was largely driven by American MNEs who were market leaders in the services and high-tech sectors. These corporations made it clear to the government that without a fundamental rebalancing of the GATT they would not continue to support a multilateral policy but would prefer a bilateral or regional track. But they did not just talk the talk; they also walked the walk, organizing business coalitions in support of services and intellectual property in Europe and Japan as well as some smaller OECD countries. The activism paid off and it is fair to say that American MNEs played a key—perhaps even the key—role in establishing the new global trading system. I will return to this shortly.

By the onset of the 1990s a major change in economic policy was underway. The debt crisis of the 1980s, and thus the role of the IMF and the World Bank, plus the fall of the Berlin Wall—a confluence of two unrelated events—ushered in a major transformation in the economic policy paradigm. Economic reforms—deregulation, privatization, and liberalization—were seen as essential elements for launching and sustaining growth. Economic regulatory reform is at the heart of the concept of trade in services. Even without the thrust from the Uruguay Round, many developing countries began to see reform of key service sectors, such as telecommunications, as essential building blocks in the soft infrastructure underpinning growth, and the GATS (General Agreement on Trade in Services) as a means of furthering domestic reform.

Thus, well before the end of the Round the hard-line coalition opposed to inclusion of the "new issues" had disappeared and coalitions of developing countries concentrated on liberalization of trade in agriculture and textiles and clothing. Many undertook unilateral liberalization of tariffs and other trade barriers, and by the conclusion of the negotiations in December 1993 were among the strongest supporters of the negotiations they had so adamantly opposed in the 1980s. What might be called a "North-South Grand Bargain" was completed and was quite different from old-time GATT reciprocity—I will open my market if you will open yours. It was essentially an implicit deal: the opening of OECD markets to agriculture and labor-intensive manufactured goods, especially textiles and clothing, in return for the inclusion in the trading system of trade in services, intellectual property and (albeit to a lesser extent than originally demanded) investment. Also—as virtually a last-minute piece of the deal—the creation of a new institution, the WTO, with the strongest dispute settlement mechanism in the history of international law. Since the WTO consisted of a "single undertaking" (in WTO legal-ese), the deal was take it or leave it for the Southern countries. So they took it but, it is safe to say, without a full comprehension of the profoundly transformative implications of this new trading system (incomprehension shared by the Northern negotiators as well I might add).

The Northern piece of the bargain consisted of some limited progress in agriculture, with a commitment to go further in new negotiations in 2000; limited progress in textiles and clothing with most of the restrictions to be eliminated later rather than sooner; and a rather significant reduction in tariffs in goods in exchange for deeper cuts by developing countries. On the whole not great but not bad when compared with previous rounds centered on traditional GATT-type market access negotiations. But this was not a GATT negotiation as the Southern piece of the deal so amply demonstrates.

The essence of the South side of the deal—the inclusion of the new issues and the creation of the new institution—requires major upgrading and change in the institutional infrastructure of many or most Southern countries. These changes will take time and cost a great deal of money. The transition periods for implementation for developing countries were arbitrary and not based on any analysis or, indeed on any awareness of the systemic problem. The North's promise to provide technical assistance was not followed up. And the new increasingly litigious and evidentiary-intensive dispute settlement system required a level of legal expertise rare in non-OECD countries, or it required large amounts of money to purchase Northern legal services.

There were two significant unintended consequences to this "Grand Bargain" (or Bum Deal). One is a broad and serious North-South divide in the WTO. While the South is hardly homogeneous there is a broad consensus in the South that the Uruguay Round should be "rebalanced" before any new negotiations are launched. The Seattle meeting in 1999 ended with the walkout of virtually all the developing countries. What is more striking is the proactive role of the South countries both before and after Seattle. They

are far better organized and informed, in part because of the rise of democracy and the growing awareness of trade policy issues among the general public, as well as in political institutions and the business community, but also in part because of the role of a number of NGOs created in developing countries during the 1990s to provide information ranging from technical research to policy strategy papers. And since the mid-1990s the Internet has accelerated the linkages of South NGOs with a number of Northern partners in both Europe and the United States. These NGOs together act, in effect, as a "virtual secretariat". Thus a new proactive South has made some demands for Uruguay Round rebalancing in the discussions in Geneva, but the Northern countries seem to be in disarray. With the end of the Cold War, the Transatlantic Alliance has weakened, strained by significant policy differences that go well beyond agriculture *per se*. (Since the events of September 11 and the forging of a coalition against terrorism perhaps a "new cold war" will change the trade policy template but that remains to be seen. The threat of terrorism is diffuse, diverse and fogged by uncertainty as is the future of the new coalition.)

The other, and equally important, unintended consequence of the Uruguay Round has been the rise in profile of the MNEs, in part due to their role in the round. For the more paranoid the round was simply a conspiratorial collusion between corporations and the U.S. government. In any case, the global current of deepening integration, accelerated by the Uruguay Round, has evoked a counter-current focused both on the MNEs and the WTO. Let me deal first with the MNEs.

III. Counter-Currents: the Corporation

The active role of the corporations in the Uruguay Round certainly raised their profile and made them a magnet for anti-trade advocates. This is evident to anyone who watched on television the battle of Seattle, or the demonstrations in Quebec, or the violence at Genoa. But before discussing those events I want to describe a less well-known but perhaps equally important development—the movement to promote "corporate responsibility".

As an offshoot of the environmental and human rights movements, and greatly facilitated by the IT (Information Technology) revolution, an increasing number of NGOs promote corporate codes of conduct—described by one businessman as "code mania". There are broadly two classes of these codes, one concerning labor standards and the other environmental practices, and they are aimed at both consumers and investors. The movement took off in the second half of the 1990s because of the Internet and increasing media attention. As the NGO that created the first Social Accountability Code (SA 8000) has aptly noted: "with instantaneous media connection and the Internet—today's remote factory scandal can become tomorrow's global headline".[1] SA 8000 was launched in 1998 on the Fiftieth Anniversary of the Universal Declaration of Human Rights (not by coincidence).

This new movement provides a good example of how the Internet has facilitated a market-like approach to the policy process. Information technology shifts power to the consumer and shareholder. Established NGOs act as policy entrepreneurs—or, as in the United States, prompt university students to create their own coalitions, such as the Union of Students against Sweatshops. In the case of consumer goods, where brand names (logos) are the chief asset, consumer and investor pressure will force firms to adopt codes. Often the NGOs work with the corporations at the firm or industry level. And recently governments have launched initiatives involving NGOs, unions and the

[1] SA 8000, *Setting the Standard for Corporate Social Accountability*: http://www.cepaa.org.

corporations such as the United Kingdom's Ethical Trading Initiative. Indeed these and similar developments involving governmental and intergovernmental institutions (such as the UN Environmental Program ("UNEP") and the OECD) have spawned a new term, "hybrid governance".[2]

As codes have proliferated criticism has mounted. Business is complaining of the paperwork burden and the lack of harmonization, although the recent (and amazing) decision by the London index company FTSE to launch a socially responsible index[3] may encourage a move toward greater harmonization. Business complaints aside, the NGOs are becoming divided between the collaborators and the confronters. In the case of the garment industry the difficulties of monitoring the suppliers in developing countries has re-launched the attack on some brand names. Southern NGOs in those countries lack the capacity to participate and argue that "ethical trade" is driven by rich students and Northern NGOs. Some unions fear that the codes could substitute for union action and erode membership. A majority of economists argue that bad jobs at bad wages and working conditions are better than no jobs at all, and that corporate social responsibility distorts the market and is bad for growth and development. Indeed, a recent study sponsored by some corporations argues that this new trend presents a fundamental threat to economic freedom and the capitalist system, and terms the corporations who participate as "collaborators as well as appeasers".[4] This attack from the right echoes that from the left fuming about a "soft counter offensive".

Thus, for every counter-current a counter-counter current surfaces. Emblematic of this phenomenon was the raucous booing by a number of NGOs at the announcement of the Global Compact by UN Secretary-General Kofi Annan. The Compact includes principles in the field of human rights, labor standards and the environment to be voluntarily adopted by multinational corporations. The initiative was attacked as an attempt to "bluewash" the nearly fifty companies who endorsed it on July 26, 2000 at UN Headquarters. While it is true that implementation and monitoring measures need to be spelled out and strengthened, the fury of the attack must have startled the Secretary-General since he has so often praised the work of the NGOs and involved them more actively in UN activities.

Be that as it may, the role of the NGOs with respect to corporate conduct goes well beyond the code movement. One example, still ongoing, is the attack on biotechnology in agriculture first aimed at Monsanto. But the most significant recent example concerns the pharmaceutical industry and the AIDS crisis in Africa. In April 2001, 39 pharmaceutical companies withdrew a lawsuit against the government of South Africa concerning the use of generic drugs. Activists who filled the Pretoria courtroom cheered wildly and the victory was heralded as a triumph of David over Goliath.

This is a stunning example, as *The Economist* noted, of how the companies were caught unaware and had already lost the battle in the "court of public opinion".[5] The campaign mobilized by Oxfam and Médecins sans Frontières was masterful and became a key element in the political agenda, especially in Europe. The framing of the issue was not only price—the costs of patented as compared to generic drugs—but larger questions of global inequality and social justice which resonated with a broader public. What is at stake for the drug companies goes well beyond the lawsuit in South Africa since it involves

[2] *See* Jennifer Clapp, *The Privatization of Global Environmental Governance: ISO 14000 and the Developing World*, 4 GLOBAL GOVERNANCE 295–316 (1998).

[3] The Index is known as the FTSE4Good Index Series. *See* www.ftse.com.

[5] *The Economist*, April 21, 2001, p. 59.

important aspects of the WTO agreement or TRIPS (trade-related intellectual property) which could significantly affect the companies' future earnings. Worse still, the NGOs attacked the drug companies' offer to sell drugs to poor countries at discount prices, and the ensuing publicity about differential pricing, a long-standing and quite legal but largely unknown practice of the industry, energized American NGOs to mobilize support for price reductions at home. But since the American market is essential to generating the profits necessary to fund the R & D for new drugs, the full impact of the attacks on Big Pharma, which could be serious for the improvement of human health, are yet to be seen. An article in an NGO publication in Africa was entitled "The AIDS Crisis Could be the Graveyard of the Patent System".[6] That is a bit of a stretch, but there is clearly a crisis not only in AIDS, but in the pharmaceutical industry itself, because there is little incentive to produce drugs for diseases predominant in poor countries since the market is only 4–6 percent of total revenues. The role of the UN in dealing with this broader issue, which involves much more than drug prices since the institutional infrastructure of the poorest countries is woefully inadequate, will be crucial.

One could plausibly argue that the full impact of the NGO campaign could have far-reaching implications both for industry and international governance. Certainly it seems likely to change the nature of the debate on TRIPS in the WTO, as the results in Doha illustrate. Whether these longer-run consequences will be good or bad will depend not only on the corporations and the NGOs, but also on the coordinated policy actions of governments and international institutions.

Perhaps the AIDS crisis and the blundering behavior of the industry—which made it the Pariah du Jour, as the Wall Street Journal put it[7]—is a one-off event and does not signal a new global counter-current aimed at global corporations. But perhaps it does. Recent polls in the United States show that a large majority believe trade and globalization mainly benefits business and the wealthy.[8] *Fortune*'s cover story is entitled "The Great CEO Pay Heist" and eye-catching figures of $100 plus million annual pay are cited.[9] Let us not forget that in 2000 *Erin Brokovitch* won an Oscar! But if that does not convince you that something is happening here, how about John le Carré's latest novel, *The Constant Gardener*, in which the villain is not a Soviet spymaster but a pharmaceutical giant? Big Pharma, the new evil empire?

Speaking of the evil empire brings us to the subject of the WTO, the institution that *unintendedly* became a global magnet for dissent.

IV. NGOs and the WTO

One of the most articulate and eloquent members of the new "globerati", Vandana Shiva, head of an Indian environmental NGO, recently described the present state of the world as follows:

> We thought we had put slavery, holocausts and apartheid behind us—that humanity would never again allow dehumanizing and violent systems to shape the rules by which we live and die. Yet globalization is giving rise to new slavery, new holocausts, new apartheid. It is a war against nature, women, children and the poor. A war which is transforming every community and home into a war zone.[10]

[10] *The Hindu*, March 25, 2001, http://www.hinduonnet.com/thehindu/2000/03/25.

The counter attack by pundits, economists and government leaders seems rather puny in comparison. Global village idiots; muddle-headed and misguided; millennial collectivists; coalitions to keep poor people poor, etc., etc. But, then as will be emphasized shortly, one of the great assets of the new policy entrepreneurs is their ability to craft a good message for the media. They seem to have the skills of a top-class advertising agency spinning a brand message.

Before expounding on their concerted attack on the WTO, I want to make clear that there is no homogeneous set of institutions called NGOs. Even if we separate out the development groups in poor countries from the advocacy NGOs, whose main objective is to shape policy, one has to divide the latter into several categories. For example, I have already noted the new virtual secretariat for Southern countries, and the groups centered on establishing business codes of conduct, both of which are rather different from what I have termed the *Mobilization Networks*, whose chief objective is to rally support for dissent at a specific event—a WTO ministerial meeting, the Summit of the Americas, a meeting of the World Bank and International Monetary Fund, the G8 Summit and so on.

The main objectives of the mobilization networks are to heighten public awareness of the target international institution's role in globalization and, by doing so, to change its agenda and mode of operation—or, in the case of the more extreme members, to shut it down. While these networks are loosely knit coalitions of very disparate groups, an analysis of the networks at Seattle (in 1999), Washington, Bangkok and Prague (in 2000) and Quebec City (in 2001) show that a significant proportion are environmental, human rights and gender rights NGOs. The G8 Summit in Genoa in July 2001 included these groups but also a number of left-wing political parties from Europe including communists and anarchists. However one must be wary of the view (often stressed by the NGOs themselves) that these loose and diverse coalitions represent a new form of globalized participatory democracy on the Internet or, as one participant has put it, "a movement that doesn't have a leader, a center, or even an agreed-on name".[11] This resembles what the wit, P.J. O'Rourke, has termed (in another context) "a clarion call to whatever". Participatory demonstrations as a form of participatory democracy? O.K, but the most significant development facilitated by the Internet—and vividly demonstrated in Seattle—has been the emergence of a new service industry—the business of dissent. And there is a business center—call it "dissent.com"—very effectively operated by a core group of NGOs headed, as noted, by a new breed of policy entrepreneurs. It is important to stress again that the dissent industry is largely a product of the Internet revolution. Inexpensive, borderless, real-time networking provides advocacy NGOs with economies of scale, and also of scope, by linking widely disparate groups with one common theme. As is the case for all innovations, there are also important positive feedback loops. An NGO Network established at the Rio Summit in 1992 was used by American, Canadian and Mexican anti-NAFTA advocacy groups and this experience was vital to mobilizing the fight against the Multilateral Agreement on Investment ("MAI"). The lessons from the MAI were put to use in preparing for Seattle, and the Seattle experience was helpful to plan for Washington and Prague and Porto Allegre and Davos and Quebec City and Genoa and so on—and on.

The key assets of dissent.com are the ability to use the media to deliver the message. Even when the message and the media are combined with money (from mass mailings and foundations—mainly American) the viability of the new business will depend not

[11] *Globe and Mail*, Toronto, April 25, 2001, p. A15.

only on the 3M's, but ultimately the saleability of its product—anti-globalization, of which, more below.

The core group central to managing the protests at Seattle and subsequent meetings, and for crafting the message and organizing the circulation of "sign on" lists or manifestos included Ralph Nader's Public Citizen and Global Trade Watch in the United States; Corporate Watch and ATTAC (France), Corporate Europe Observatory (Amsterdam), Oxfam (U. K. and Belgium); FOE or Friends of the Earth (in the U.K. and elsewhere) and the Third World Network of Malaysia, the most prominent transnational Southern NGO. A number of other NGOs were involved in facilitating the demonstrations in Seattle, Washington and Prague. Thus the Direct Action Network ("DAN"), with offices in California and New York, began as a coalition of activist groups dedicated to shutting down the WTO Ministerial. (Direct action is a term derived from the anarchist movement in the nineteenth and twentieth century: indeed it was the central ideology of the movement.) DAN was inspired by Peoples' Global Action ("PGA") which was formed in Geneva for the first WTO Ministerial in 1998. PGA was the organizer of the first Carnival against Capitalism in London in June 1999 which almost shut down the City of London's financial district largely as a result of the activities of the anarchist Black Bloc. PGA was also involved in the Quebec demonstrations through its Canadian arm CLAC or Anti-Capitalist Convergence of Montreal. In Prague INPEG was formed to plan and carry out a week of protest from September 18–28, 2000. The European NGOs were anxious to replicate Seattle, regarded as an impressive "model." ATTAC, a French group established in 1998 after the 1997 financial crisis, has vastly expanded since then and organized the anti-Davos demonstrations in Porto Allegre, Brazil, which, in turn, fed into the planning for Quebec City. At Genoa, ATTAC was preeminent, having expanded around Europe and in Latin America. The demonstrations and discussions were coordinated by the Genoa Social Forum, which was not able to plan for or control the violence of both extremist groups and the police—a not new but very much heightened aspect of this form of advocacy (see below).

Coordinating and organizing the demonstrations is only one function of dissent.com. Another, of equal or greater importance, is creating the libretto for the street operas and the television sound bites. Since the networks are so diverse, both in mission and location, the message must carry a simple, common theme: anti-globalization: pro-democracy. The charge is that the WTO (or the IMF, or the World Bank) are dominated by the interests of transnational corporations, while harming the environment and increasing inequality, and that their rules and procedures are undemocratic and kept secret from the public. Examples of sound bite versions at Seattle were "fix it or nix it"; and after Seattle, "shrink it or sink it" and at Washington "De-fund the Fund! Break the Bank! Dump the Debt!" A major theme which could be read on the Internet at least a year before Quebec City was the attack on government secrecy and the demand to release the draft of the FTAA ("Free Trade Area of the Americas"). But it is well to note that even when the message and the media are combined with money (for those NGOs successful at mass mailings and securing funds from Foundations—mainly American) the viability of the new business will depend ultimately on the saleability of its product—dissent. If the brand is tarnished the strategy and/or tactics may have to change, of which more below.

Since the main objective of mobilization networks is to influence public opinion and through that route initiate change in the policy processes of the international institutions, has the dissent industry been successful? In the case of the WTO, I would argue that it is too early to tell. The claim that the protests shut down the Seattle meeting does not stand up to close scrutiny. It was the North-South divide and Clinton's remarks on using

sanctions to enforce labor standards that caused the Southern countries to walk out. The NGOs also claim that Seattle was the "big bang" of a new social movement. It is similar to the claim that the 1997 Asian Crisis was the "Stalingrad of the IMF". Still, there is no question that the WTO and member governments are concerned about the mounting attacks and that they seem to be at a loss to respond.

This evident policy paralysis among the industrialized countries has many causes, but it stands in marked contrast to the activism of the NGOs. Thus a highly coordinated global-regional strategy was evident in the planning for the Quebec Summit of the Americas. While some of the "Seattle plus" core groups were actively involved, the umbrella network for Quebec City—the Hemispheric Social Alliance—was conceived at Belo Horizonte, Brazil, in May, 1997 when 700 activists (many of them part of the anti-NAFTA network) decided to build a hemispheric movement. The Allianza includes Canadian and American mobilization networks, plus Mexican, Brazilian and Chilean NGOs who are building linkages with Andean, Southern Cone and Caribbean groups. The AFL/CIO, the CLC and ORIT (the Western Hemisphere Union Federation) were all deeply involved in the planning process.

This involvement of unions outside Canada and the United States is new, and it is too early to know what it means. While the AFL-CIO played a major role in Seattle, European and many developing country unions have been prominent by their absence in the dissent industry. This was also evident in Genoa where some unionists were involved but the mainline Federations refused to endorse the protests. The International Confederation of Free Trade Unions ("ICFTU") did however hold a steering committee meeting in Genoa (to plan for Doha) and met with Italian Prime Minister Berlusconi. A North-South split is also evident in the environmental movement. Southern NGOs are more concerned with development, and regard the priorities of their Northern cousins as a reflection of their own standard of living and lack of understanding of the poverty of the developing countries. In the muttering in the corridors of the WTO and environmental conferences one often hears complaints that "they" (Northern NGOs) prefer support for elephants over people, and dolphins over children, and development NGOs are often described as "the new missionaries."

So, was Seattle a "big bang" for a new global movement? If so, whom will the movement include? At present, it seems unlikely that workers of the world will unite. They are, at present, competing, and in Southern countries their governments are competing ferociously for foreign investment. So many Southern workers figure that they could have something to lose other than their chains, i.e. their jobs.

Will greens of the world unite? The environmental movement has played an important role in the policy process since the 1970s and was actively involved in the most significant of the 200-plus Multilateral Environmental Agreements of the past decades. They often have more technical expertise than governments or business or intergovernmental institutions. The largest and most active environmental NGOs ("ENGOs") have affiliates around the world although their "home base" or place of origin is or was primarily the United States. A few examples illustrate the point. Greenpeace Amsterdam has organizations in twenty countries; Friends of the Earth in fifty, the World Wildlife Fund in 28. All are expanding rapidly. And they have money, with annual incomes of well over $200 million. As Mike Moore, then head of the WTO, said after Seattle: "the annual budget of WWF ($350 million in 2000) is three times that of the WTO". Most of these ENGOs recognize the need to bridge the North-South divide and to win over other groups, such as women and anti-globalization advocates, and are adapting their strategies to include development, gender and social issues (such as the need to prevent any negotiations on

education and health services in the WTO). This may attract some public service union support in Europe. In terms of strategy they seem to be more perceptive and flexible than the corporations and the governments they attack.

Forging a truly global social movement uniting diverse single-interest NGOs—a coalition of "hedgehogs" in Isaiah Berlin's terminology[12]—would require more than agreement on who is the enemy. It would require some agreement on an alternative. Indeed, since Seattle what one reads on the Internet is a growing and lively debate on this issue of trying to define a systemic alternative to the neo-liberal paradigm. At this point in time—not surprisingly—that goal seems to be a long way off. One idea which is gaining currency is localization. A book now being widely touted is called *Localization: A Global Manifesto* by Colin Hines.[13] While not exactly a yearning for some Edenic past, a close reading raises many more questions than answers. For example, just how would you define local—he has many different suggestions—and how would you get countries to agree to stop all trade except that which involves essential products that are not produced locally? One is reminded of the anarchist writings of the nineteenth and early twentieth centuries and the failed effort to establish an anarchist regime which was destroyed by the Spanish Civil War.[14] The anarchist movement did not have a single, powerful spokesman like their most hated enemies—the Communists—so their ideas are diffuse and somewhat amorphous. But confederal arrangements of small communities with no central or hierarchical authority is a unifying theme. The term anarchy is today associated with violence but the anarchist ethic was libertarian (as extreme as today's right wing) and violence was an individual right. The ideas of "direct action" and "diversity of tactics" are stressed by many of the NGOs today so that the echoes are clear. Be that as it may, the Edenic confederal bottom up model—a model of deglobalization—reminds one of the definition of a romantic: one who prefers to travel hopefully rather than arrive at a destination.

Of course, some alternative must be found, if only because dissent.com is worried about the continued saleability of its product. The violence at Genoa had shaken many of the prominent international groups such as FOE, and most of the development NGOs such as Oxfam. But the extremists are not only left-wing anarchists. As the Southern Poverty Law Center, a U.S. NGO, has documented, neo-fascist groups in Britain, Europe and the United States have also embraced the anti-globalization credo with enthusiasm. In Europe the development of the so-called "International Third Position" created by a breakaway faction of the U.K.'s neofascist National Front and Italian Fascists, has increasingly gained a following among the hard right internationally. The ITP represents a fusion of left and right (including environmentalism, wealth redistribution and workers' cooperatives) but their basic objective is to identify the prime enemies (Jews, blacks and immigrants). The Center underlines, of course, that "left and right did not exactly march arm-in-arm" in Seattle,[15] nor did the neo-nazi skinheads join hands with the development NGOs in Prague or Genoa. Yet the probably inevitable tendency for all demonstrations to attract extremists—a free ride is hard to decline—is generating increasing concern within the more mainline NGO community. Escalating violence generates the need for more police security which likewise generates more violence and attracts more extremists. And, of course, Genoa was hardly the end of the story.

The terrorist attack of September 11, 2001—while unrelated to the anti-globalization movement *per se*—will greatly add to the pressure to adopt a new strategy, or the dissent industry and dissent.com may prove to be just a bubble like other dotcoms. Indeed there are those who believe that the movement has been decimated. There appears to be a widening split among the NGOs who fear being tarnished by the events of Genoa and, *a fortiori*, September 11 and those more strident and extreme coalitions who regard global capitalism as bereft of all values other than greed (and are trying to mobilize a peace movement). It is interesting to note that even before the Washington annual meetings of the Fund and the Bank were cancelled in September 2001 because of the terrorist attack on Washington, a number of organizations (the AFL-CIO, Friends of the Earth, Sierra Club, Oxfam, for example) announced that they would not join in any protests and were scathingly denounced by others (especially anarchists) as cowardly traitors to a just cause. Whether or not the dissent industry is dead is open to debate but the need to transform strategy seems clear enough. And some innovation is already evident.

Thus to "demonstrate or not to demonstrate" is not the only question facing the mobilization networks. It may be well that the international institutions will be more and more apprehensive about holding meetings for fear of violence and cost. Certainly security measures will be vastly increased. One indication of a possible alternative could be to conference "on-line" as the World Bank did after cancelling a planned meeting in Barcelona in May 2001. The Bank was well aware of another new "global movement"—hacktivism, or the use of computers to organize "electronic civil disobedience" by defacing websites; organizing virtual sit-ins by generating massive electronic traffic to block other users; or creating denial of service. But it hired an outside firm to handle the conference and provide expert anti-hacking protection.[16] The conference went ahead with no glitches (despite threats to "crack the whole event") but the spread of hacktivism has just begun and cannot be dismissed. Some firms are now beginning to set up special units for threat analysis—IBM being a leader since it provides service for corporate systems around the world.[17] Perhaps new security arrangements instituted as a result of September 11 will make hacktivism more difficult but one should not be complacent about the potential for what one anarchist group has termed cyber trench-warfare. As noted earlier the internet was necessary for dissent.com to mobilize *action*: now it could become the *site* for action as hackers become politicized and activists become computerized. Indeed if mainline NGOs decide that demonstrations as a strategy are no longer viable this might make marching in the cyber trenches more attractive for some of the extremists. Nonetheless, whatever emerges from this new phenomenon (and it is both too early to tell and too difficult to obtain information) hacktivism is unlikely to provide an alternative to the major objectives of the mobilization networks, i.e. build a global social movement against corporate globalization.

Finally, how can one sum up the implications of the growing NGO movement, its impact on policy so far, and its future? During the several years in which I have been researching this subject my answer has been based on the 1960s lyrics "Something's happening here; what it is ain't exactly clear". That got a good laugh, especially from baby boomers. But while I still stand by the song title I now believe that something is

Denning, *Activisim, Hacktisivm, and Cyberterrorism: The Internet as a Tool for Influencing Foreign Policy* and references cited therein, www.nautilus.org/info-policy/workshop/papers/denning.html.

becoming clearer, i.e., the 1990s was probably a *defining decade*, perhaps a transition to a new political economy of international policy-making. Let me now conclude with a brief review of the defining decade—with a question mark.

V. The 1990s: The Defining Decade?

Some 2,500 year ago Aristotle offered a very useful way of organizing explanations of events or actions. Despite all the recent complex theories of tipping and cascades and the like, I prefer Aristotle's simplicity and clarity. For a development to occur it must be: (1) *possible,* (2) there must be an *incentive*, and (3) there must be a *catalyst* to precipitate the actions.

The element that made the anti-globalization movement *possible* was the Internet. There were anti-WTO demonstrations in Geneva and Washington in the early 1990s where buildings were plastered with posters of a big, ferocious GATTZILLA, but it is far cheaper and more effective to mobilize marches in cyberspace than fly around with posters that manage mainly to irritate the proper burghers of a Swiss canton famed for its squeaky clean appearance.

Of course, the Internet could only serve as an instrument of mobilization if the *incentive* to employ it was shared by a sufficient number of participants. This is a far more complex story, indeed not one but many different stories around the world. But a common theme or trigger is that overzealous proponents of "free trade" or globalization unleashed unrealistic expectations. If you promise but cannot deliver Nirvana it is bound to evoke cries of Armageddon from the disapproving and the disappointed. In many developing countries this anger and disappointment is threatening already fragile democracies. Moreover, increasing inequality, both within and especially among countries, has been highlighted by the media and effectively used by many NGOs. The figures are stunning and many are quoted. For example, today the richest one per cent of the world's population receives as much as the bottom 57 percent.[18] It is not just poverty that marks the increasing marginalization of the poorest, but disease, and not only AIDS, but Ebola, and drug-resistant bacterial infections. But, of course, freer trade did not create the growing inequality in economic and social conditions, nor will blocking trade cure these problems. While the link between trade and growth is complex, trade policy is certainly an ingredient in the policy package and what is quite clear is that growth is essential for the reduction of poverty. But in the absence of the political leadership required to confront the slow, complicated and arduous process of coordinating trade and development policies it is easy for politicians to yield to the temptation of promising simple solutions—trade is the holy grail of growth.

The counter-currents of the 1990s in the industrialized countries reinforce deeper currents that have been flowing silently for several decades. The most ubiquitous trend in all the rich countries is the declining confidence in government which began in the mid-1970s. There are many differing views on the reasons for this striking phenomenon and no doubt different factors are operative in different countries.[19] Nonetheless the similarity in trend cannot be ignored. The disillusionment and decline in deference applies not only

[18] Branko Milanovic, *True World Income Distribution, 1988 and 1993: First Calculations Based on Household Surveys Alone*, World Bank, Development Research Group, Oct. 1999, at 52.

[19] *See* Susan J. Pharr, Robert D. Putnam, and Russell J. Dalton, *A Quarter-Century of Declining Confidence*, II JOURNAL OF DEMOCRACY (April 2000). The "new war" has, at least at present, reversed the trend in the United States. But as unemployment rises and growth slows the relevance of domestic versus security issues is likely to rise.

to all government institutions but also to political parties, i.e., to the political underpinnings of the entire democratic system. Robert Putnam, in his best-selling book *Bowling Alone*, has argued that this growing alienation is also reflected in the United States by the collapse of citizen engagement in voluntary community groups, and that this in turn reinforces the trend toward alienation which has been longer and steeper than in Europe. Interestingly, Putnam notes the rise of advocacy NGOs at the same time as the decline in community activities, but argues that these social movements do not countervail the decline and have no real ties to the people they claim to represent, but rather to consumers of a cause. He argues that this is not participatory democracy but "citizenship by proxy".[20]

While, as noted, there is no agreement on the reasons for this disturbing decline in deference to the democratic political system, among the factors most often cited are the greater importance of information and the role of the media. At the same time, it does not seem entirely coincidental that the spread of the NGO movement, at least in North America, began in the late 1970s with the gender and environmental groups leading the way, and was very much abetted by the media. If the political route to change is increasingly disdained, then the advocacy route may be a better bet. Indeed, in a recent publication, *Strengthening Canadian Democracy*, survey data reveals that in the year 2000, sixty percent of the sample perceived interest groups as more effective than political parties as compared with twenty percent who held the opposite view.[21] This is hardly unique. In a recent global survey carried out by a prominent American public relations firm, the results strongly confirm the low trust / confidence in government and suggest that the NGOs are now Super-Brands which provide a "halo effect".[22]

After this long detour, let us return to Aristotle. The alienation from government and from politics in the industrialized countries opened up a now widening space in the policy arena for the burgeoning NGO movement. They were already active in certain parts of the arena—especially in the environmental parts—in the 1980s, both domestically and internationally. There was thus a strong *incentive* to play a larger role in a wider policy arena. The Internet in the mid-90s made entry into the global arena *possible.* So, what was the *catalyst*—Aristotle's third condition?

I have already suggested my own answer—the Uruguay Round. The move away from the border barriers of the *GATT system,* with more freedom to protect domestic policy space, to a *WTO system* which weakened domestic regulatory policies and domestic institutions, touched the raw nerve of national sovereignty. No discussion took place during the Round about the need to redefine domestic policy space in a world in which the economic regulatory state was to be reformed and the social regulatory state—a feature mainly of the rich countries—was unacceptable to many developing countries, especially if trade sanctions were to be used to enforce, say, labor or environmental standards. The WTO was provided with a pitiful budget for technical assistance and research, and the litigious (and therefore expensive) dispute settlement system has provoked complaints in a number of Northern and Southern countries. Finally, the prominent role of business in defining the new agenda provided an easy and attractive target as public concern over the growing power of corporations began to mount.

So, Aristotelian logic would support the argument that the last decade of the twentieth century was a defining decade, perhaps signaling a transition to an even more powerful counter-current to the ongoing and accelerating current of global integration. After all, it has happened before. By the end of the nineteenth century international trade and financial flows were actually greater, in relation to production, than they are today. The rise of protectionism, the Great Depression, and the Second World War put an end to that. It is certainly possible—but in my view highly improbable—to turn back the tide.

Even if the Canute school of anti-globalizers does not win, this will not mean that the counter-current will subside. There are a number of other signals worth noting that suggest that while it may take different forms it will not go away. Let me cite a few.

I have been struck in my reading on this subject how often two words appear—*alienation* and *anomie.* The first is from Marx and, as the great biographer of Keynes, Robert Skidelsky, has noted, the idea of alienation, which is essentially a moral critique of capitalism, is all that is left from the debris of his theory.[23] Marx argued that because labor becomes a commodity in the capitalist system, the worker loses all power to control the processes by which decisions are made that affect his life. Fast forward 150 years and think: mindless consumption of the rich; the need for participation; the need to give power to the local community, etc.

The other word now enjoying a revival is *anomie*, as used by the French sociologist Emile Durkheim,[24] writing at the beginning of the twentieth century. Marx and Durkheim agreed on a number of things: most importantly that an individual is a social being and not a cog in a machine. Both agreed that the culprit was utilitarianism, the basis of neo-classical economics. But they strongly disagreed on the consequences. For Marx alienation equaled "exploitation of the working class" which must lead to revolution; for Durkheim, it led to anomie. Anomie is essentially a disconnect between the goals generated by society and the institutional means to achieve them. If winning is the goal most exalted by society and you cannot achieve it by the normal rules of the game, then cheating is the best available option. If money is the only symbol of achievement, and you cannot be certain you will get the right job when you graduate, then cheating is the logical option to ensure success. The idea of anomie was brilliantly captured in David Riesman's *The Lonely Crowd*,[25] published in 1950, which stressed the individual's sense of powerlessness and loss of social cohesion. When anomie is confined to a small number they can form groups—alienated from the rest of society but unified within themselves. The neo-Nazis provide a good example. But if widely dispersed groups can unite around one *theme*—say, feminism or environmentalism—that is a qualitatively different phenomenon, and if facilitated by the Internet could produce a quantum change.

I think anomie is a useful concept to explain the spread of NGOs and their concerted attack on global integration and trade policy. The disjuncture between the goals of free trade—rising living standards for all—and its distributional impact is taken as evidence that international treaties do not deliver. The evidence that over the past fifty years, the period of increasing integration of the global economy, the proportion of the world's population living in poverty has declined more than in the previous 500 years is ignored. Rather than discussing the basic issues of how to cope with poverty—and there are no simple answers—it seems easier to choose the alternative route—to use

[23] Robert Skidelsky, *What's Left of Marx?*, NEW YORK REVIEW OF BOOKS 27 (Nov. 16, 2000).

[24] For a comprehensive review of Durkheim's concept see ROBERT K. MERTON, SOCIAL THEORY AND SOCIAL STRUCTURE (1966). *See also* ANTHONY GIDDENS, EMILE DURKHEIM SELECTED WRITINGS (1972).

[25] DAVID RIESMAN, THE LONELY CROWD (1950).

Durkheim's terminology, *deinstitutionalization.* Because governments are complicit in this disjuncture, their legitimacy must also be rejected.

If anomie and alienation are increasing in the rich democracies, the implications go well beyond the anti-globalization movement. If disillusionment with the political process has facilitated the rise of the advocacy NGOs, what effect will this have on national democracy itself? The continued attack on government, however well-merited, is combined with a rejection of long-established and fought-for political routes to policy reform. Are participatory demonstrations a satisfactory substitute for participatory democracy? If the arguments that capitalism lacks a moral ethos or that the economy must be embedded in society are legitimate—and, indeed, a growing number of economists including the Nobel laureate Amartya Sen are making that case—then domestic reform is essential. Is it not more easily achieved by working *within* the system than *rejecting* it? Rejecting it in favor of what? The concept of an alternative in this domestic context has not even been raised, let alone discussed. Thus the implications of the "counter-current against global integration" for *national democracy* are probably more important than its *international* impact.

I do not wish to conclude on an entirely pessimistic note. Many of the international NGOs have played a singularly important role in highlighting the inadequacies of the new global trading system as well as the international financial system. A number of NGOs, aware of the charge that they are non-transparent and not accountable, are adopting codes of conduct and establishing monitoring mechanisms. Further, the WTO has made an effort to increase access to information and its website today vastly improves accessibility. New consultations with NGOs have been launched and more are likely. But will they achieve their goal of restoring the "legitimacy" of the institution? One can agree with many of the criticisms of the WTO. The institution would benefit from debate and dialogue but has no forum to host such a process. A new round that fails to grapple with institutional reform will accomplish little. But one should keep in mind Churchill's dictum that democracy is the worst form of government—except for all the others. The same is true of the WTO, which is a rules-based system, flawed as it may be. The only alternative on the horizon at present is a power-based system. Who should benefit from such a system? Certainly the powerful countries and the MNEs. Who would lose the most from such a system? Obviously the poorer countries and their poorest citizens. Reform of the WTO will require action by its member governments. Maybe NGO pressure should begin at home.

Appendix
WTO Ministerial Declarations and Doha Work Programme Decision Adopted by the General Council

SINGAPORE MINISTERIAL DECLARATION
Adopted on 13 December 1996

1. We, the Ministers, have met in Singapore from 9 to 13 December 1996 for the first regular biennial meeting of the WTO at Ministerial level, as called for in Article IV of the Agreement Establishing the World Trade Organization, to further strengthen the WTO as a forum for negotiation, the continuing liberalization of trade within a rule-based system, and the multilateral review and assessment of trade policies, and in particular to:

- assess the implementation of our commitments under the WTO Agreements and decisions;
- review the ongoing negotiations and Work Programme;
- examine developments in world trade; and
- address the challenges of an evolving world economy.

Trade and Economic Growth

2. For nearly 50 years Members have sought to fulfil, first in the GATT and now in the WTO, the objectives reflected in the preamble to the WTO Agreement of conducting our trade relations with a view to raising standards of living worldwide. The rise in global trade facilitated by trade liberalization within the rules-based system has created more and better-paid jobs in many countries. The achievements of the WTO during its first two years bear witness to our desire to work together to make the most of the possibilities that the multilateral system provides to promote sustainable growth and development while contributing to a more stable and secure climate in international relations.

Integration of Economies; Opportunities and Challenges

3. We believe that the scope and pace of change in the international economy, including the growth in trade in services and direct investment, and the increasing integration of economies offer unprecedented opportunities for improved growth, job creation, and development. These developments require adjustment by economies and societies. They also pose challenges to the trading system. We commit ourselves to address these challenges.

Core Labour Standards

4. We renew our commitment to the observance of internationally recognized core labour standards. The International Labour Organization (ILO) is the competent body to set and deal with these standards, and we affirm our support for its work in promoting them. We believe that economic growth and development fostered by increased trade and further trade liberalization contribute to the promotion of these standards. We reject the use of labour standards for protectionist purposes, and agree that the comparative advantage of countries, particularly low-wage developing countries, must in no way be

put into question. In this regard, we note that the WTO and ILO Secretariats will continue their existing collaboration.

Marginalization

5. We commit ourselves to address the problem of marginalization for least-developed countries, and the risk of it for certain developing countries. We will also continue to work for greater coherence in international economic policy-making and for improved coordination between the WTO and other agencies in providing technical assistance.

Role of WTO

6. In pursuit of the goal of sustainable growth and development for the common good, we envisage a world where trade flows freely. To this end we renew our commitment to:

- a fair, equitable and more open rule-based system;
- progressive liberalization and elimination of tariff and non-tariff barriers to trade in goods;
- progressive liberalization of trade in services;
- rejection of all forms of protectionism;
- elimination of discriminatory treatment in international trade relations;
- integration of developing and least-developed countries and economies in transition into the multilateral system; and
- the maximum possible level of transparency.

Regional Agreements

7. We note that trade relations of WTO Members are being increasingly influenced by regional trade agreements, which have expanded vastly in number, scope and coverage. Such initiatives can promote further liberalization and may assist least-developed, developing and transition economies in integrating into the international trading system. In this context, we note the importance of existing regional arrangements involving developing and least-developed countries. The expansion and extent of regional trade agreements make it important to analyse whether the system of WTO rights and obligations as it relates to regional trade agreements needs to be further clarified. We reaffirm the primacy of the multilateral trading system, which includes a framework for the development of regional trade agreements, and we renew our commitment to ensure that regional trade agreements are complementary to it and consistent with its rules. In this regard, we welcome the establishment and endorse the work of the new Committee on Regional Trade Agreements. We shall continue to work through progressive liberalization in the WTO as we are committed in the WTO Agreement and Decisions adopted at Marrakesh, and in so doing facilitate mutually supportive processes of global and regional trade liberalization.

Accessions

8. It is important that the 28 applicants now negotiating accession contribute to completing the accession process by accepting the WTO rules and by offering meaningful market access commitments. We will work to bring these applicants expeditiously into the WTO system.

Dispute Settlement

9. The Dispute Settlement Understanding (DSU) offers a means for the settlement of disputes among Members that is unique in international agreements. We consider its impartial and transparent operation to be of fundamental importance in assuring the resolution of trade disputes, and in fostering the implementation and application of the WTO agreements. The Understanding, with its predictable procedures, including the possibility of appeal of panel decisions to an Appellate Body and provisions on implementation of recommendations, has improved Members' means of resolving their differences. We believe that the DSU has worked effectively during its first two years. We also note the role that several WTO bodies have played in helping to avoid disputes. We renew our determination to abide by the rules and procedures of the DSU and other WTO agreements in the conduct of our trade relations and the settlement of disputes. We are confident that longer experience with the DSU, including the implementation of panel and appellate recommendations, will further enhance the effectiveness and credibility of the dispute settlement system.

Implementation

10. We attach high priority to full and effective implementation of the WTO Agreement in a manner consistent with the goal of trade liberalization. Implementation thus far has been generally satisfactory, although some Members have expressed dissatisfaction with certain aspects. It is clear that further effort in this area is required, as indicated by the relevant WTO bodies in their reports. Implementation of the specific commitments scheduled by Members with respect to market access in industrial goods and trade in services appears to be proceeding smoothly. With respect to industrial market access, monitoring of implementation would be enhanced by the timely availability of trade and tariff data. Progress has been made also in advancing the WTO reform programme in agriculture, including in implementation of agreed market access concessions and domestic subsidy and export subsidy commitments.

Notifications and Legislation

11. Compliance with notification requirements has not been fully satisfactory. Because the WTO system relies on mutual monitoring as a means to assess implementation, those Members which have not submitted notifications in a timely manner, or whose notifications are not complete, should renew their efforts. At the same time, the relevant bodies should take appropriate steps to promote full compliance while considering practical proposals for simplifying the notification process.

12. Where legislation is needed to implement WTO rules, Members are mindful of their obligations to complete their domestic legislative process without further delay. Those Members entitled to transition periods are urged to take steps as they deem necessary to ensure timely implementation of obligations as they come into effect. Each Member should carefully review all its existing or proposed legislation, programmes and measures to ensure their full compatibility with the WTO obligations, and should carefully consider points made during review in the relevant WTO bodies regarding the WTO consistency of legislation, programmes and measures, and make appropriate changes where necessary.

Developing Countries

13. The integration of developing countries in the multilateral trading system is important for their economic development and for global trade expansion. In this connection, we recall that the WTO Agreement embodies provisions conferring differential and more favourable treatment for developing countries, including special attention to the particular situation of least-developed countries. We acknowledge the fact that developing country Members have undertaken significant new commitments, both substantive and procedural, and we recognize the range and complexity of the efforts that they are making to comply with them. In order to assist them in these efforts, including those with respect to notification and legislative requirements, we will improve the availability of technical assistance under the agreed guidelines. We have also agreed to recommendations relative to the decision we took at Marrakesh concerning the possible negative effects of the agricultural reform programme on least-developed and net food-importing developing countries.

Least-Developed Countries

14. We remain concerned by the problems of the least-developed countries and have agreed to:

- a Plan of Action, including provision for taking positive measures, for example duty-free access, on an autonomous basis, aimed at improving their overall capacity to respond to the opportunities offered by the trading system;
- seek to give operational content to the Plan of Action, for example, by enhancing conditions for investment and providing predictable and favourable market access conditions for LLDCs' products, to foster the expansion and diversification of their exports to the markets of all developed countries; and in the case of relevant developing countries in the context of the Global System of Trade Preferences; and
- organize a meeting with UNCTAD and the International Trade Centre as soon as possible in 1997, with the participation of aid agencies, multilateral financial institutions and least-developed countries to foster an integrated approach to assisting these countries in enhancing their trading opportunities.

Textiles and Clothing

15. We confirm our commitment to full and faithful implementation of the provisions of the Agreement on Textiles and Clothing (ATC). We stress the importance of the integration of textile products, as provided for in the ATC, into GATT 1994 under its strengthened rules and disciplines because of its systemic significance for the rule-based, non-discriminatory trading system and its contribution to the increase in export earnings of developing countries. We attach importance to the implementation of this Agreement so as to ensure an effective transition to GATT 1994 by way of integration which is progressive in character. The use of safeguard measures in accordance with ATC provisions should be as sparing as possible. We note concerns regarding the use of other trade distortive measures and circumvention. We reiterate the importance of fully implementing the provisions of the ATC relating to small suppliers, new entrants and least-developed country Members, as well as those relating to cotton-producing exporting Members. We recognize the importance of wool products for some developing country

Members. We reaffirm that as part of the integration process and with reference to the specific commitments undertaken by the Members as a result of the Uruguay Round, all Members shall take such action as may be necessary to abide by GATT 1994 rules and disciplines so as to achieve improved market access for textiles and clothing products. We agree that, keeping in view its quasi-judicial nature, the Textiles Monitoring Body (TMB) should achieve transparency in providing rationale for its findings and recommendations. We expect that the TMB shall make findings and recommendations whenever called upon to do so under the Agreement. We emphasize the responsibility of the Goods Council in overseeing, in accordance with Article IV:5 of the WTO Agreement and Article 8 of the ATC, the functioning of the ATC, whose implementation is being supervised by the TMB.

Trade and Environment

16. The Committee on Trade and Environment has made an important contribution towards fulfilling its Work Programme. The Committee has been examining and will continue to examine, *inter alia*, the scope of the complementarities between trade liberalization, economic development and environmental protection. Full implementation of the WTO Agreements will make an important contribution to achieving the objectives of sustainable development. The work of the Committee has underlined the importance of policy coordination at the national level in the area of trade and environment. In this connection, the work of the Committee has been enriched by the participation of environmental as well as trade experts from Member governments and the further participation of such experts in the Committee's deliberations would be welcomed. The breadth and complexity of the issues covered by the Committee's Work Programme shows that further work needs to be undertaken on all items of its agenda, as contained in its report. We intend to build on the work accomplished thus far, and therefore direct the Committee to carry out its work, reporting to the General Council, under its existing terms of reference.

Services Negotiations

17. The fulfilment of the objectives agreed at Marrakesh for negotiations on the improvement of market access in services—in financial services, movement of natural persons, maritime transport services and basic telecommunications—has proved to be difficult. The results have been below expectations. In three areas, it has been necessary to prolong negotiations beyond the original deadlines. We are determined to obtain a progressively higher level of liberalization in services on a mutually advantageous basis with appropriate flexibility for individual developing country Members, as envisaged in the Agreement, in the continuing negotiations and those scheduled to begin no later than 1 January 2000. In this context, we look forward to full MFN agreements based on improved market access commitments and national treatment. Accordingly, we will:

- achieve a successful conclusion to the negotiations on basic telecommunications in February 1997; and
- resume financial services negotiations in April 1997 with the aim of achieving significantly improved market access commitments with a broader level of participation in the agreed time frame.

With the same broad objectives in mind, we also look forward to a successful conclusion of the negotiations on Maritime Transport Services in the next round of negotiations on services liberalization.

In professional services, we shall aim at completing the work on the accountancy sector by the end of 1997, and will continue to develop multilateral disciplines and guidelines. In this connection, we encourage the successful completion of international standards in the accountancy sector by IFAC, IASC, and IOSCO. With respect to GATS rules, we shall undertake the necessary work with a view to completing the negotiations on safeguards by the end of 1997. We also note that more analytical work will be needed on emergency safeguards measures, government procurement in services and subsidies.

ITA and Pharmaceuticals

18. Taking note that a number of Members have agreed on a Declaration on Trade in Information Technology Products, we welcome the initiative taken by a number of WTO Members and other States or separate customs territories which have applied to accede to the WTO, who have agreed to tariff elimination for trade in information technology products on an MFN basis as well as the addition by a number of Members of over 400 products to their lists of tariff-free products in pharmaceuticals.

Work Programme and Built-in Agenda

19. Bearing in mind that an important aspect of WTO activities is a continuous overseeing of the implementation of various agreements, a periodic examination and updating of the WTO Work Programme is a key to enable the WTO to fulfil its objectives. In this context, we endorse the reports of the various WTO bodies. A major share of the Work Programme stems from the WTO Agreement and decisions adopted at Marrakesh. As part of these Agreements and decisions we agreed to a number of provisions calling for future negotiations on Agriculture, Services and aspects of TRIPS, or reviews and other work on Anti-Dumping, Customs Valuation, Dispute Settlement Understanding, Import Licensing, Preshipment Inspection, Rules of Origin, Sanitary and Phyto-Sanitary Measures, Safeguards, Subsidies and Countervailing Measures, Technical Barriers to Trade, Textiles and Clothing, Trade Policy Review Mechanism, Trade-Related Aspects of Intellectual Property Rights and Trade-Related Investment Measures. We agree to a process of analysis and exchange of information, where provided for in the conclusions and recommendations of the relevant WTO bodies, on the Built-in Agenda issues, to allow Members to better understand the issues involved and identify their interests before undertaking the agreed negotiations and reviews. We agree that:

- the time frames established in the Agreements will be respected in each case;
- the work undertaken shall not prejudge the scope of future negotiations where such negotiations are called for; and
- the work undertaken shall not prejudice the nature of the activity agreed upon (i.e. negotiation or review).

Investment and Competition

20. Having regard to the existing WTO provisions on matters related to investment and competition policy and the built-in agenda in these areas, including under the TRIMs

Agreement, and on the understanding that the work undertaken shall not prejudge whether negotiations will be initiated in the future, we also agree to:

- establish a working group to examine the relationship between trade and investment; and
- establish a working group to study issues raised by Members relating to the interaction between trade and competition policy, including anti-competitive practices, in order to identify any areas that may merit further consideration in the WTO framework.

These groups shall draw upon each other's work if necessary and also draw upon and be without prejudice to the work in UNCTAD and other appropriate intergovernmental fora. As regards UNCTAD, we welcome the work under way as provided for in the Midrand Declaration and the contribution it can make to the understanding of issues. In the conduct of the work of the working groups, we encourage cooperation with the above organizations to make the best use of available resources and to ensure that the development dimension is taken fully into account. The General Council will keep the work of each body under review, and will determine after two years how the work of each body should proceed. It is clearly understood that future negotiations, if any, regarding multilateral disciplines in these areas, will take place only after an explicit consensus decision is taken among WTO Members regarding such negotiations.

Transparency in Government Procurement

21. We further agree to:

- establish a working group to conduct a study on transparency in government procurement practices, taking into account national policies, and, based on this study, to develop elements for inclusion in an appropriate agreement; and
- direct the Council for Trade in Goods to undertake exploratory and analytical work, drawing on the work of other relevant international organizations, on the simplification of trade procedures in order to assess the scope for WTO rules in this area.

Trade Facilitation

22. In the organization of the work referred to in paragraphs 20 and 21, careful attention will be given to minimizing the burdens on delegations, especially those with more limited resources, and to coordinating meetings with those of relevant UNCTAD bodies. The technical cooperation programme of the Secretariat will be available to developing and, in particular, least-developed country Members to facilitate their participation in this work.

23. Noting that the 50th anniversary of the multilateral trading system will occur early in 1998, we instruct the General Council to consider how this historic event can best be commemorated.

Finally, we express our warmest thanks to the Chairman of the Ministerial Conference, Mr. Yeo Cheow Tong, for his personal contribution to the success of this Ministerial Conference. We also want to express our sincere gratitude to Prime Minister

Goh Chok Tong, his colleagues in the Government of Singapore and the people of Singapore for their warm hospitality and the excellent organization they have provided. The fact that this first Ministerial Conference of the WTO has been held at Singapore is an additional manifestation of Singapore's commitment to an open world trading system.

MINISTERIAL DECLARATION ON TRADE IN INFORMATION TECHNOLOGY PRODUCTS
Singapore, 13 December 1996

Ministers,

Representing the following Members of the World Trade Organization ("WTO"), and States or separate customs territories in the process of acceding to the WTO, which have agreed in Singapore on the expansion of world trade in information technology products and which account for well over 80 per cent of world trade in these products ("parties"):

Australia	Norway
Canada	Separate Customs Territory of Taiwan,
European Communities	Penghu, Kinmen and Matsu
Hong Kong	Singapore
Iceland	Switzerland[1]
Indonesia	Turkey
Japan	United States
Korea	

Considering the key role of trade in information technology products in the development of information industries and in the dynamic expansion of the world economy,

Recognizing the goals of raising standards of living and expanding the production of and trade in goods;

Desiring to achieve maximum freedom of world trade in information technology products;

Desiring to encourage the continued technological development of the information technology industry on a world-wide basis;

Mindful of the positive contribution information technology makes to global economic growth and welfare;

Having agreed to put into effect the results of these negotiations which involve concessions additional to those included in the Schedules attached to the Marrakesh Protocol to the General Agreement on Tariffs and Trade 1994, and

Recognizing that the results of these negotiations also involve some concessions offered in negotiations leading to the establishment of Schedules annexed to the Marrakesh Protocol,

Declare as follows:

1. Each party's trade regime should evolve in a manner that enhances market access opportunities for information technology products.

2. Pursuant to the modalities set forth in the Annex to this Declaration, each party shall bind and eliminate customs duties and other duties and charges of any kind, within

[1] On behalf of the customs union Switzerland and Liechtenstein.

the meaning of Article II:1(b) of the General Agreement on Tariffs and Trade 1994, with respect to the following:

(a) all products classified (or classifiable) with Harmonized System (1996) ("HS") headings listed in Attachment A to the Annex to this Declaration; and
(b) all products specified in Attachment B to the Annex to this Declaration, whether or not they are included in Attachment A;

through equal rate reductions of customs duties beginning in 1997 and concluding in 2000, recognizing that extended staging of reductions and, before implementation, expansion of product coverage may be necessary in limited circumstances.

3. Ministers express satisfaction about the large product coverage outlined in the Attachments to the Annex to this Declaration. They instruct their respective officials to make good faith efforts to finalize plurilateral technical discussions in Geneva on the basis of these modalities, and instruct these officials to complete this work by 31 January 1997, so as to ensure the implementation of this Declaration by the largest number of participants.

4. Ministers invite the Ministers of other Members of the WTO, and States or separate customs territories in the process of acceding to the WTO, to provide similar instructions to their respective officials, so that they may participate in the technical discussions referred to in paragraph 3 above and participate fully in the expansion of world trade in information technology products.

Annex: Modalities and Product Coverage

Atttachment A: list of HS headings [omitted]
Atttachment B: list of products [omitted]

ANNEX

MODALITIES AND PRODUCT COVERAGE

Any Member of the World Trade Organization, or State or separate customs territory in the process of acceding to the WTO, may participate in the expansion of world trade in information technology products in accordance with the following modalities:

1. Each participant shall incorporate the measures described in paragraph 2 of the Declaration into its schedule to the General Agreement on Tariffs and Trade 1994, and, in addition, at either its own tariff line level or the Harmonized System (1996) ("HS") 6-digit level in either its official tariff or any other published versions of the tariff schedule, whichever is ordinarily used by importers and exporters. Each participant that is not a Member of the WTO shall implement these measures on an autonomous basis, pending completion of its WTO accession, and shall incorporate these measures into its WTO market access schedule for goods.

2. To this end, as early as possible and no later than 1 March 1997 each participant shall provide all other participants a document containing (a) the details concerning how the appropriate duty treatment will be provided in its WTO schedule of concessions, and (b) a list of the detailed HS headings involved for products specified in Attachment B. These documents will be reviewed and approved on a consensus basis and this review process shall be completed no later than 1 April 1997. As soon as this review process has been completed for any such document, that document shall be submitted as a modification to the Schedule of the participant concerned, in accordance with the Decision of 26 March 1980 on Procedures for Modification and Rectification of Schedules of Tariff Concessions (BISD 27S/25).

(a) The concessions to be proposed by each participant as modifications to its Schedule shall bind and eliminate all customs duties and other duties and charges of any kind on information technology products as follows:
   (i) elimination of such customs duties shall take place through rate reductions in equal steps, except as may be otherwise agreed by the participants. Unless otherwise agreed by the participants, each participant shall bind all tariffs on items listed in the Attachments no later than 1 July 1997, and shall make the first such rate reduction effective no later than 1 July 1997, the second such rate reduction no later than 1 January 1998, and the third such rate reduction no later than 1 January 1999, and the elimination of customs duties shall be completed effective no later than 1 January 2000. The participants agree to encourage autonomous elimination of customs duties prior to these dates. The reduced rate should in each stage be rounded off to the first decimal; and
   (ii) elimination of such other duties and charges of any kind, within the meaning of Article II:1(b) of the General Agreement, shall be completed by 1 July 1997, except as may be otherwise specified in the participant's document provided to other participants for review.

(b) The modifications to its Schedule to be proposed by a participant in order to implement its binding and elimination of customs duties on information technology products shall achieve this result:

(i) in the case of the HS headings listed in Attachment A, by creating, where appropriate, sub-divisions in its Schedule at the national tariff line level; and
(ii) in the case of the products specified in Attachment B, by attaching an annex to its Schedule including all products in Attachment B, which is to specify the detailed HS headings for those products at either the national tariff line level or the HS 6-digit level.

Each participant shall promptly modify its national tariff schedule to reflect the modifications it has proposed, as soon as they have entered into effect.

3. Participants shall meet periodically under the auspices of the Council on Trade in Goods to review the product coverage specified in the Attachments, with a view to agreeing, by consensus, whether in the light of technological developments, experience in applying the tariff concessions, or changes to the HS nomenclature, the Attachments should be modified to incorporate additional products, and to consult on non-tariff barriers to trade in information technology products. Such consultations shall be without prejudice to rights and obligations under the WTO Agreement.

4. Participants shall meet as soon as practicable and in any case no later than 1 April 1997 to review the state of acceptances received and to assess the conclusions to be drawn therefrom. Participants will implement the actions foreseen in the Declaration provided that participants representing approximately 90 per cent of world trade[2] in information technology products have by then notified their acceptance, and provided that the staging has been agreed to the participants' satisfaction. In assessing whether to implement actions foreseen in the Declaration, if the percentage of world trade represented by participants falls somewhat short of 90 per cent of world trade in information technology products, participants may take into account the extent of the participation of States or separate customs territories representing for them the substantial bulk of their own trade in such products. At this meeting the participants will establish whether these criteria have been met.

5. Participants shall meet as often as necessary and no later than 30 September 1997 to consider any divergence among them in classifying information technology products, beginning with the products specified in Attachment B. Participants agree on the common objective of achieving, where appropriate, a common classification for these products within existing HS nomenclature, giving consideration to interpretations and rulings of the Customs Co-operation Council (also known as the World Customs Organization or "WCO"). In any instance in which a divergence in classification remains, participants will consider whether a joint suggestion could be made to the WCO with regard to updating existing HS nomenclature or resolving divergence in interpretation of the HS nomenclature.

6. The participants understand that Article XXIII of the General Agreement will address nullification or impairment of benefits accruing directly or indirectly to a WTO Member participant through the implementation of this Declaration as a result of the application by another WTO Member participant of any measure, whether or not that measure conflicts with the provisions of the General Agreement.

7. Each participant shall afford sympathetic consideration to any request for consultation from any other participant concerning the undertakings set out above. Such consultations shall be without prejudice to rights and obligations under the WTO Agreement.

[2] This percentage shall be calculated by the WTO Secretariat on the basis of the most recent data available at the time of the meaning.

8. Participants acting under the auspices of the Council for Trade in Goods shall inform other Members of the WTO and States or separate customs territories in the process of acceding to the WTO of these modalities and initiate consultations with a view to facilitate their participation in the expansion of trade in information technology products on the basis of the Declaration.

9. As used in these modalities, the term "participant" shall mean those Members of the WTO, or States or separate customs territories in the process of acceding to the WTO, that provide the document described in paragraph 2 no later than 1 March 1997.

10. This Annex shall be open for acceptance by all Members of the WTO and any State or any separate customs territory in the process of acceding to the WTO. Acceptances shall be notified in writing to the Director-General who shall communicate them to all participants.

GENEVA
MINISTERIAL DECLARATION
Adopted on 20 May 1998

1. This Second Session of the Ministerial Conference of the WTO is taking place at a particularly significant time for the multilateral trading system, when the fiftieth anniversary of its establishment is being commemorated. On this occasion we pay tribute to the system's important contribution over the past half-century to growth, employment and stability by promoting the liberalization and expansion of trade and providing a framework for the conduct of international trade relations, in accordance with the objectives embodied in the Preambles to the General Agreement on Tariffs and Trade and the World Trade Organization Agreement. We agree, however, that more remains to be done to enable all the world's peoples to share fully and equitably in these achievements.

2. We underline the crucial importance of the multilateral rule-based trading system. We reaffirm the commitments and assessments we made at Singapore, and we note that the work under existing agreements and decisions has resulted in significant new steps forward since we last met. In particular, we welcome the successful conclusion of the negotiations on basic telecommunications and financial services and we take note of the implementation of the Information Technology Agreement. We renew our commitment to achieve progressive liberalization of trade in goods and services.

3. The fiftieth anniversary comes at a time when the economies of a number of WTO Members are experiencing difficulties as a result of disturbances in financial markets. We take this opportunity to underline that keeping all markets open must be a key element in a durable solution to these difficulties. With this in mind, we reject the use of any protectionist measures and agree to work together in the WTO as in the IMF and the World Bank to improve the coherence of international economic policy-making with a view to maximizing the contribution that an open, rule-based trading system can make to fostering stable growth for economies at all levels of development.

4. We recognize the importance of enhancing public understanding of the benefits of the multilateral trading system in order to build support for it and agree to work towards this end. In this context we will consider how to improve the transparency of WTO operations. We shall also continue to improve our efforts towards the objectives of sustained economic growth and sustainable development.

5. We renew our commitment to ensuring that the benefits of the multilateral trading system are extended as widely as possible. We recognize the need for the system to make its own contribution in response to the particular trade interests and development needs of developing-country Members. We welcome the work already underway in the Committee on Trade and Development for reviewing the application of special provisions in the Multilateral Trade Agreements and related Ministerial Decisions in favour of developing country Members, and in particular the least-developed among them. We agree on the need for effective implementation of these special provisions.

6. We remain deeply concerned over the marginalization of least-developed countries and certain small economies, and recognize the urgent need to address this issue which has been compounded by the chronic foreign debt problem facing many of them. In

this context we welcome the initiatives taken by the WTO in cooperation with other agencies to implement in an integrated manner the Plan of Action for the least-developed countries which we agreed at Singapore, especially through the High-Level Meeting on Least-Developed Countries held in Geneva in October 1997. We also welcome the report of the Director-General on the follow-up of this initiative, to which we attach great importance. We commit ourselves to continue to improve market access conditions for products exported by the least-developed countries on as broad and liberal a basis as possible. We urge Members to implement the market-access commitments that they have undertaken at the High-Level Meeting.

7. We welcome the WTO Members who have joined since we met in Singapore: Congo, Democratic Republic of Congo, Mongolia, Niger and Panama. We welcome the progress made with 31 applicants currently negotiating their accession and renew our resolution to ensure that the accession processes proceed as rapidly as possible. We recall that accession to the WTO requires full respect of WTO rules and disciplines as well as meaningful market access commitments on the part of acceding candidates.

8. Full and faithful implementation of the WTO Agreement and Ministerial Decisions is imperative for the credibility of the multilateral trading system and indispensable for maintaining the momentum for expanding global trade, fostering job creation and raising standards of living in all parts of the world. When we meet at the Third Session we shall further pursue our evaluation of the implementation of individual agreements and the realization of their objectives. Such evaluation would cover, *inter alia*, the problems encountered in implementation and the consequent impact on the trade and development prospects of Members. We reaffirm our commitment to respect the existing schedules for reviews, negotiations and other work to which we have already agreed.

9. We recall that the Marrakesh Agreement Establishing the World Trade Organization states that the WTO shall provide the forum for negotiations among its Members concerning their multilateral trade relations in matters dealt with under the agreements in the Annexes to the Agreement, and that it may also provide a forum for further negotiations among its Members concerning their multilateral trade relations, and a framework for the implementation of the results of such negotiations, as may be decided by the Ministerial Conference. In the light of paragraphs 1–8 above, we decide that a process will be established under the direction of the General Council to ensure full and faithful implementation of existing agreements, and to prepare for the Third Session of the Ministerial Conference. This process shall enable the General Council to submit recommendations regarding the WTO's work programme, including further liberalization sufficiently broad-based to respond to the range of interests and concerns of all Members, within the WTO framework, that will enable us to take decisions at the Third Session of the Ministerial Conference. In this regard, the General Council will meet in special session in September 1998 and periodically thereafter to ensure full and timely completion of its work, fully respecting the principle of decision-making by consensus.

The General Council's work programme shall encompass the following:

(a) recommendations concerning:
  (i) the issues, including those brought forward by Members, relating to implementation of existing agreements and decisions;
  (ii) the negotiations already mandated at Marrakesh, to ensure that such negotiations begin on schedule;
  (iii) future work already provided for under other existing agreements and decisions taken at Marrakesh;

(b) recommendations concerning other possible future work on the basis of the work programme initiated at Singapore;
(c) recommendations on the follow-up to the High-Level Meeting on Least-Developed Countries;
(d) recommendations arising from consideration of other matters proposed and agreed to by Members concerning their multilateral trade relations.

10. The General Council will also submit to the Third Session of the Ministerial Conference, on the basis of consensus, recommendations for decision concerning the further organization and management of the work programme arising from the above, including the scope, structure and time-frames, that will ensure that the work programme is begun and concluded expeditiously.

11. The above work programme shall be aimed at achieving overall balance of interests of all Members.

GENEVA
DECLARATION ON GLOBAL ELECTRONIC COMMERCE
Adopted on 20 May 1998

Ministers,

Recognizing that global electronic commerce is growing and creating new opportunities for trade,

Declare that:

The General Council shall, by its next meeting in special session, establish a comprehensive work programme to examine all trade-related issues relating to global electronic commerce, including those issues identified by Members. The work programme will involve the relevant World Trade Organization ("WTO") bodies, take into account the economic, financial, and development needs of developing countries, and recognize that work is also being undertaken in other international fora. The General Council should produce a report on the progress of the work programme and any recommendations for action to be submitted at our third session. Without prejudice to the outcome of the work programme or the rights and obligations of Members under the WTO Agreements, we also declare that Members will continue their current practice of not imposing customs duties on electronic transmissions.

When reporting to our third session, the General Council will review this declaration, the extension of which will be decided by consensus, taking into account the progress of the work programme.

DOHA
MINISTERIAL DECLARATION
Adopted on 14 November 2001

1. The multilateral trading system embodied in the World Trade Organization has contributed significantly to economic growth, development and employment throughout the past fifty years. We are determined, particularly in the light of the global economic slowdown, to maintain the process of reform and liberalization of trade policies, thus ensuring that the system plays its full part in promoting recovery, growth and development. We therefore strongly reaffirm the principles and objectives set out in the Marrakesh Agreement Establishing the World Trade Organization, and pledge to reject the use of protectionism.

2. International trade can play a major role in the promotion of economic development and the alleviation of poverty. We recognize the need for all our peoples to benefit from the increased opportunities and welfare gains that the multilateral trading system generates. The majority of WTO Members are developing countries. We seek to place their needs and interests at the heart of the Work Programme adopted in this Declaration. Recalling the Preamble to the Marrakesh Agreement, we shall continue to make positive efforts designed to ensure that developing countries, and especially the least-developed among them, secure a share in the growth of world trade commensurate with the needs of their economic development. In this context, enhanced market access, balanced rules, and well targeted, sustainably financed technical assistance and capacity-building programmes have important roles to play.

3. We recognize the particular vulnerability of the least-developed countries and the special structural difficulties they face in the global economy. We are committed to addressing the marginalization of least-developed countries in international trade and to improving their effective participation in the multilateral trading system. We recall the commitments made by Ministers at our meetings in Marrakesh, Singapore and Geneva, and by the international community at the Third UN Conference on Least-Developed Countries in Brussels, to help least-developed countries secure beneficial and meaningful integration into the multilateral trading system and the global economy. We are determined that the WTO will play its part in building effectively on these commitments under the Work Programme we are establishing.

4. We stress our commitment to the WTO as the unique forum for global trade rule-making and liberalization, while also recognizing that regional trade agreements can play an important role in promoting the liberalization and expansion of trade and in fostering development.

5. We are aware that the challenges Members face in a rapidly changing international environment cannot be addressed through measures taken in the trade field alone. We shall continue to work with the Bretton Woods institutions for greater coherence in global economic policy-making.

6. We strongly reaffirm our commitment to the objective of sustainable development, as stated in the Preamble to the Marrakesh Agreement. We are convinced that the aims of upholding and safeguarding an open and non-discriminatory multilateral trading system,

and acting for the protection of the environment and the promotion of sustainable development can and must be mutually supportive. We take note of the efforts by Members to conduct national environmental assessments of trade policies on a voluntary basis. We recognize that under WTO rules no country should be prevented from taking measures for the protection of human, animal or plant life or health, or of the environment at the levels it considers appropriate, subject to the requirement that they are not applied in a manner which would constitute a means of arbitrary or unjustifiable discrimination between countries where the same conditions prevail, or a disguised restriction on international trade, and are otherwise in accordance with the provisions of the WTO Agreements. We welcome the WTO's continued cooperation with UNEP and other inter-governmental environmental organizations. We encourage efforts to promote cooperation between the WTO and relevant international environmental and developmental organizations, especially in the lead-up to the World Summit on Sustainable Development to be held in Johannesburg, South Africa, in September 2002.

7. We reaffirm the right of Members under the General Agreement on Trade in Services to regulate, and to introduce new regulations on, the supply of services.

8. We reaffirm our declaration made at the Singapore Ministerial Conference regarding internationally recognized core labour standards. We take note of work under way in the International Labour Organization (ILO) on the social dimension of globalization.

9. We note with particular satisfaction that this Conference has completed the WTO accession procedures for China and Chinese Taipei. We also welcome the accession as new Members, since our last Session, of Albania, Croatia, Georgia, Jordan, Lithuania, Moldova and Oman, and note the extensive market-access commitments already made by these countries on accession. These accessions will greatly strengthen the multilateral trading system, as will those of the 28 countries now negotiating their accession. We therefore attach great importance to concluding accession proceedings as quickly as possible. In particular, we are committed to accelerating the accession of least-developed countries.

10. Recognizing the challenges posed by an expanding WTO membership, we confirm our collective responsibility to ensure internal transparency and the effective participation of all Members. While emphasizing the intergovernmental character of the organization, we are committed to making the WTO's operations more transparent, including through more effective and prompt dissemination of information, and to improve dialogue with the public. We shall therefore at the national and multilateral levels continue to promote a better public understanding of the WTO and to communicate the benefits of a liberal, rules-based multilateral trading system.

11. In view of these considerations, we hereby agree to undertake the broad and balanced Work Programme set out below. This incorporates both an expanded negotiating agenda and other important decisions and activities necessary to address the challenges facing the multilateral trading system.

Work Programme

Implementation-Related Issues and Concerns

12. We attach the utmost importance to the implementation-related issues and concerns raised by Members and are determined to find appropriate solutions to them. In this connection, and having regard to the General Council Decisions of 3 May and 15 December 2000, we further adopt the Decision on Implementation-Related Issues and Concerns

in document WT/MIN(01)/17 to address a number of implementation problems faced by Members. We agree that negotiations on outstanding implementation issues shall be an integral part of the Work Programme we are establishing, and that agreements reached at an early stage in these negotiations shall be treated in accordance with the provisions of paragraph 47 below. In this regard, we shall proceed as follows: (a) where we provide a specific negotiating mandate in this Declaration, the relevant implementation issues shall be addressed under that mandate; (b) the other outstanding implementation issues shall be addressed as a matter of priority by the relevant WTO bodies, which shall report to the Trade Negotiations Committee, established under paragraph 46 below, by the end of 2002 for appropriate action.

Agriculture

13. We recognize the work already undertaken in the negotiations initiated in early 2000 under Article 20 of the Agreement on Agriculture, including the large number of negotiating proposals submitted on behalf of a total of 121 Members. We recall the long-term objective referred to in the Agreement to establish a fair and market-oriented trading system through a programme of fundamental reform encompassing strengthened rules and specific commitments on support and protection in order to correct and prevent restrictions and distortions in world agricultural markets. We reconfirm our commitment to this programme. Building on the work carried out to date and without prejudging the outcome of the negotiations we commit ourselves to comprehensive negotiations aimed at: substantial improvements in market access; reductions of, with a view to phasing out, all forms of export subsidies; and substantial reductions in trade-distorting domestic support. We agree that special and differential treatment for developing countries shall be an integral part of all elements of the negotiations and shall be embodied in the Schedules of concessions and commitments and as appropriate in the rules and disciplines to be negotiated, so as to be operationally effective and to enable developing countries to effectively take account of their development needs, including food security and rural development. We take note of the non-trade concerns reflected in the negotiating proposals submitted by Members and confirm that non-trade concerns will be taken into account in the negotiations as provided for in the Agreement on Agriculture.

14. Modalities for the further commitments, including provisions for special and differential treatment, shall be established no later than 31 March 2003. Participants shall submit their comprehensive draft Schedules based on these modalities no later than the date of the Fifth Session of the Ministerial Conference. The negotiations, including with respect to rules and disciplines and related legal texts, shall be concluded as part and at the date of conclusion of the negotiating agenda as a whole.

Services

15. The negotiations on trade in services shall be conducted with a view to promoting the economic growth of all trading partners and the development of developing and least-developed countries. We recognize the work already undertaken in the negotiations, initiated in January 2000 under Article XIX of the General Agreement on Trade in Services, and the large number of proposals submitted by Members on a wide range of sectors and several horizontal issues, as well as on movement of natural persons. We reaffirm the Guidelines and Procedures for the Negotiations adopted by the Council for Trade in Services on 28 March 2001 as the basis for continuing the negotiations, with

a view to achieving the objectives of the General Agreement on Trade in Services, as stipulated in the Preamble, Article IV and Article XIX of that Agreement. Participants shall submit initial requests for specific commitments by 30 June 2002 and initial offers by 31 March 2003.

Market Access for Non-agricultural Products

16. We agree to negotiations which shall aim, by modalities to be agreed, to reduce or as appropriate eliminate tariffs, including the reduction or elimination of tariff peaks, high tariffs, and tariff escalation, as well as non-tariff barriers, in particular on products of export interest to developing countries. Product coverage shall be comprehensive and without *a priori* exclusions. The negotiations shall take fully into account the special needs and interests of developing and least-developed country participants, including through less than full reciprocity in reduction commitments, in accordance with the relevant provisions of Article XXVIII *bis* of GATT 1994 and the provisions cited in paragraph 50 below. To this end, the modalities to be agreed will include appropriate studies and capacity-building measures to assist least-developed countries to participate effectively in the negotiations.

Trade-Related Aspects of Intellectual Property Rights

17. We stress the importance we attach to implementation and interpretation of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) in a manner supportive of public health, by promoting both access to existing medicines and research and development into new medicines and, in this connection, are adopting a separate Declaration.

18. With a view to completing the work started in the Council for Trade-Related Aspects of Intellectual Property Rights (Council for TRIPS) on the implementation of Article 23.4, we agree to negotiate the establishment of a multilateral system of notification and registration of geographical indications for wines and spirits by the Fifth Session of the Ministerial Conference. We note that issues related to the extension of the protection of geographical indications provided for in Article 23 to products other than wines and spirits will be addressed in the Council for TRIPS pursuant to paragraph 12 of this Declaration.

19. We instruct the Council for TRIPS, in pursuing its work programme including under the review of Article 27.3(b), the review of the implementation of the TRIPS Agreement under Article 71.1 and the work foreseen pursuant to paragraph 12 of this Declaration, to examine, *inter alia*, the relationship between the TRIPS Agreement and the Convention on Biological Diversity, the protection of traditional knowledge and folklore, and other relevant new developments raised by Members pursuant to Article 71.1. In undertaking this work, the TRIPS Council shall be guided by the objectives and principles set out in Articles 7 and 8 of the TRIPS Agreement and shall take fully into account the development dimension.

Relationship Between Trade and Investment

20. Recognizing the case for a multilateral framework to secure transparent, stable and predictable conditions for long-term cross-border investment, particularly foreign direct investment, that will contribute to the expansion of trade, and the need for enhanced

technical assistance and capacity-building in this area as referred to in paragraph 21, we agree that negotiations will take place after the Fifth Session of the Ministerial Conference on the basis of a decision to be taken, by explicit consensus, at that Session on modalities of negotiations.

21. We recognize the needs of developing and least-developed countries for enhanced support for technical assistance and capacity building in this area, including policy analysis and development so that they may better evaluate the implications of closer multilateral cooperation for their development policies and objectives, and human and institutional development. To this end, we shall work in cooperation with other relevant intergovernmental organisations, including UNCTAD, and through appropriate regional and bilateral channels, to provide strengthened and adequately resourced assistance to respond to these needs.

22. In the period until the Fifth Session, further work in the Working Group on the Relationship Between Trade and Investment will focus on the clarification of: scope and definition; transparency; non-discrimination; modalities for pre-establishment commitments based on a GATS-type, positive list approach; development provisions; exceptions and balance-of-payments safeguards; consultation and the settlement of disputes between Members. Any framework should reflect in a balanced manner the interests of home and host countries, and take due account of the development policies and objectives of host governments as well as their right to regulate in the public interest. The special development, trade and financial needs of developing and least-developed countries should be taken into account as an integral part of any framework, which should enable Members to undertake obligations and commitments commensurate with their individual needs and circumstances. Due regard should be paid to other relevant WTO provisions. Account should be taken, as appropriate, of existing bilateral and regional arrangements on investment.

Interaction Between Trade and Competition Policy

23. Recognizing the case for a multilateral framework to enhance the contribution of competition policy to international trade and development, and the need for enhanced technical assistance and capacity-building in this area as referred to in paragraph 24, we agree that negotiations will take place after the Fifth Session of the Ministerial Conference on the basis of a decision to be taken, by explicit consensus, at that Session on modalities of negotiations.

24. We recognize the needs of developing and least-developed countries for enhanced support for technical assistance and capacity building in this area, including policy analysis and development so that they may better evaluate the implications of closer multilateral cooperation for their development policies and objectives, and human and institutional development. To this end, we shall work in cooperation with other relevant intergovernmental organisations, including UNCTAD, and through appropriate regional and bilateral channels, to provide strengthened and adequately resourced assistance to respond to these needs.

25. In the period until the Fifth Session, further work in the Working Group on the Interaction between Trade and Competition Policy will focus on the clarification of: core principles, including transparency, non-discrimination and procedural fairness, and provisions on hardcore cartels; modalities for voluntary cooperation; and support for progressive reinforcement of competition institutions in developing countries through capacity building. Full account shall be taken of the needs of developing and least-developed country participants and appropriate flexibility provided to address them.

Transparency in Government Procurement

26. Recognizing the case for a multilateral agreement on transparency in government procurement and the need for enhanced technical assistance and capacity building in this area, we agree that negotiations will take place after the Fifth Session of the Ministerial Conference on the basis of a decision to be taken, by explicit consensus, at that Session on modalities of negotiations. These negotiations will build on the progress made in the Working Group on Transparency in Government Procurement by that time and take into account participants' development priorities, especially those of least-developed country participants. Negotiations shall be limited to the transparency aspects and therefore will not restrict the scope for countries to give preferences to domestic supplies and suppliers. We commit ourselves to ensuring adequate technical assistance and support for capacity building both during the negotiations and after their conclusion.

Trade Facilitation

27. Recognizing the case for further expediting the movement, release and clearance of goods, including goods in transit, and the need for enhanced technical assistance and capacity building in this area, we agree that negotiations will take place after the Fifth Session of the Ministerial Conference on the basis of a decision to be taken, by explicit consensus, at that Session on modalities of negotiations. In the period until the Fifth Session, the Council for Trade in Goods shall review and as appropriate, clarify and improve relevant aspects of Articles V, VIII and X of the GATT 1994 and identify the trade facilitation needs and priorities of Members, in particular developing and least-developed countries. We commit ourselves to ensuring adequate technical assistance and support for capacity building in this area.

WTO Rules

28. In the light of experience and of the increasing application of these instruments by Members, we agree to negotiations aimed at clarifying and improving disciplines under the Agreements on Implementation of Article VI of the GATT 1994 and on Subsidies and Countervailing Measures, while preserving the basic concepts, principles and effectiveness of these Agreements and their instruments and objectives, and taking into account the needs of developing and least-developed participants. In the initial phase of the negotiations, participants will indicate the provisions, including disciplines on trade distorting practices, that they seek to clarify and improve in the subsequent phase. In the context of these negotiations, participants shall also aim to clarify and improve WTO disciplines on fisheries subsidies, taking into account the importance of this sector to developing countries. We note that fisheries subsidies are also referred to in paragraph 31.

29. We also agree to negotiations aimed at clarifying and improving disciplines and procedures under the existing WTO provisions applying to regional trade agreements. The negotiations shall take into account the developmental aspects of regional trade agreements.

Dispute Settlement Understanding

30. We agree to negotiations on improvements and clarifications of the Dispute Settlement Understanding. The negotiations should be based on the work done thus far as well as any additional proposals by Members, and aim to agree on improvements and

clarifications not later than May 2003, at which time we will take steps to ensure that the results enter into force as soon as possible thereafter.

Trade and Environment

31. With a view to enhancing the mutual supportiveness of trade and environment, we agree to negotiations, without prejudging their outcome, on:

(i) the relationship between existing WTO rules and specific trade obligations set out in multilateral environmental agreements (MEAs). The negotiations shall be limited in scope to the applicability of such existing WTO rules as among parties to the MEA in question. The negotiations shall not prejudice the WTO rights of any Member that is not a party to the MEA in question;
(ii) procedures for regular information exchange between MEA Secretariats and the relevant WTO committees, and the criteria for the granting of observer status;
(iii) the reduction or, as appropriate, elimination of tariff and non-tariff barriers to environmental goods and services.

We note that fisheries subsidies form part of the negotiations provided for in paragraph 28.

32. We instruct the Committee on Trade and Environment, in pursuing work on all items on its agenda within its current terms of reference, to give particular attention to:

(i) the effect of environmental measures on market access, especially in relation to developing countries, in particular the least-developed among them, and those situations in which the elimination or reduction of trade restrictions and distortions would benefit trade, the environment and development;
(ii) the relevant provisions of the Agreement on Trade-Related Aspects of Intellectual Property Rights; and
(iii) labelling requirements for environmental purposes.

Work on these issues should include the identification of any need to clarify relevant WTO rules. The Committee shall report to the Fifth Session of the Ministerial Conference, and make recommendations, where appropriate, with respect to future action, including the desirability of negotiations. The outcome of this work as well as the negotiations carried out under paragraph 31(i) and (ii) shall be compatible with the open and non-discriminatory nature of the multilateral trading system, shall not add to or diminish the rights and obligations of Members under existing WTO agreements, in particular the Agreement on the Application of Sanitary and Phytosanitary Measures, nor alter the balance of these rights and obligations, and will take into account the needs of developing and least-developed countries.

33. We recognize the importance of technical assistance and capacity building in the field of trade and environment to developing countries, in particular the least-developed among them. We also encourage that expertise and experience be shared with Members wishing to perform environmental reviews at the national level. A report shall be prepared on these activities for the Fifth Session.

Electronic Commerce

34. We take note of the work which has been done in the General Council and other relevant bodies since the Ministerial Declaration of 20 May 1998 and agree to continue the Work Programme on Electronic Commerce. The work to date demonstrates that electronic commerce creates new challenges and opportunities for trade for Members at all

stages of development, and we recognize the importance of creating and maintaining an environment which is favourable to the future development of electronic commerce. We instruct the General Council to consider the most appropriate institutional arrangements for handling the Work Programme, and to report on further progress to the Fifth Session of the Ministerial Conference. We declare that Members will maintain their current practice of not imposing customs duties on electronic transmissions until the Fifth Session.

Small Economies

35. We agree to a work programme, under the auspices of the General Council, to examine issues relating to the trade of small economies. The objective of this work is to frame responses to the trade-related issues identified for the fuller integration of small, vulnerable economies into the multilateral trading system, and not to create a sub-category of WTO Members. The General Council shall review the work programme and make recommendations for action to the Fifth Session of the Ministerial Conference.

Trade, Debt and Finance

36. We agree to an examination, in a Working Group under the auspices of the General Council, of the relationship between trade, debt and finance, and of any possible recommendations on steps that might be taken within the mandate and competence of the WTO to enhance the capacity of the multilateral trading system to contribute to a durable solution to the problem of external indebtedness of developing and least-developed countries, and to strengthen the coherence of international trade and financial policies, with a view to safeguarding the multilateral trading system from the effects of financial and monetary instability. The General Council shall report to the Fifth Session of the Ministerial Conference on progress in the examination.

Trade and Transfer of Technology

37. We agree to an examination, in a Working Group under the auspices of the General Council, of the relationship between trade and transfer of technology, and of any possible recommendations on steps that might be taken within the mandate of the WTO to increase flows of technology to developing countries. The General Council shall report to the Fifth Session of the Ministerial Conference on progress in the examination.

Technical Cooperation and Capacity Building

38. We confirm that technical cooperation and capacity building are core elements of the development dimension of the multilateral trading system, and we welcome and endorse the New Strategy for WTO Technical Cooperation for Capacity Building, Growth and Integration. We instruct the Secretariat, in coordination with other relevant agencies, to support domestic efforts for mainstreaming trade into national plans for economic development and strategies for poverty reduction. The delivery of WTO technical assistance shall be designed to assist developing and least-developed countries and low-income countries in transition to adjust to WTO rules and disciplines, implement obligations and exercise the rights of membership, including drawing on the benefits of an open, rules-based multilateral trading system. Priority shall also be accorded to small, vulnerable,

and transition economies, as well as to Members and Observers without representation in Geneva. We reaffirm our support for the valuable work of the International Trade Centre, which should be enhanced.

39. We underscore the urgent necessity for the effective coordinated delivery of technical assistance with bilateral donors, in the OECD Development Assistance Committee and relevant international and regional intergovernmental institutions, within a coherent policy framework and timetable. In the coordinated delivery of technical assistance, we instruct the Director-General to consult with the relevant agencies, bilateral donors and beneficiaries, to identify ways of enhancing and rationalizing the Integrated Framework for Trade-Related Technical Assistance to Least-Developed Countries and the Joint Integrated Technical Assistance Programme (JITAP).

40. We agree that there is a need for technical assistance to benefit from secure and predictable funding. We therefore instruct the Committee on Budget, Finance and Administration to develop a plan for adoption by the General Council in December 2001 that will ensure long-term funding for WTO technical assistance at an overall level no lower than that of the current year and commensurate with the activities outlined above.

41. We have established firm commitments on technical cooperation and capacity building in various paragraphs in this Ministerial Declaration. We reaffirm these specific commitments contained in paragraphs 16, 21, 24, 26, 27, 33, 38–40, 42 and 43, and also reaffirm the understanding in paragraph 2 on the important role of sustainably financed technical assistance and capacity-building programmes. We instruct the Director-General to report to the Fifth Session of the Ministerial Conference, with an interim report to the General Council in December 2002 on the implementation and adequacy of these commitments in the identified paragraphs.

Least-Developed Countries

42. We acknowledge the seriousness of the concerns expressed by the least-developed countries (LDCs) in the Zanzibar Declaration adopted by their Ministers in July 2001. We recognize that the integration of the LDCs into the multilateral trading system requires meaningful market access, support for the diversification of their production and export base, and trade-related technical assistance and capacity building. We agree that the meaningful integration of LDCs into the trading system and the global economy will involve efforts by all WTO Members. We commit ourselves to the objective of duty-free, quota-free market access for products originating from LDCs. In this regard, we welcome the significant market access improvements by WTO Members in advance of the Third UN Conference on LDCs (LDC-III), in Brussels, May 2001. We further commit ourselves to consider additional measures for progressive improvements in market access for LDCs. Accession of LDCs remains a priority for the Membership. We agree to work to facilitate and accelerate negotiations with acceding LDCs. We instruct the Secretariat to reflect the priority we attach to LDCs' accessions in the annual plans for technical assistance. We reaffirm the commitments we undertook at LDC-III, and agree that the WTO should take into account, in designing its work programme for LDCs, the trade-related elements of the Brussels Declaration and Programme of Action, consistent with the WTO's mandate, adopted at LDC-III. We instruct the Sub-Committee for Least-Developed Countries to design such a work programme and to report on the agreed work programme to the General Council at its first meeting in 2002.

43. We endorse the Integrated Framework for Trade-Related Technical Assistance to Least-Developed Countries (IF) as a viable model for LDCs' trade development. We

urge development partners to significantly increase contributions to the IF Trust Fund and WTO extra-budgetary trust funds in favour of LDCs. We urge the core agencies, in coordination with development partners, to explore the enhancement of the IF with a view to addressing the supply-side constraints of LDCs and the extension of the model to all LDCs, following the review of the IF and the appraisal of the ongoing Pilot Scheme in selected LDCs. We request the Director-General, following coordination with heads of the other agencies, to provide an interim report to the General Council in December 2002 and a full report to the Fifth Session of the Ministerial Conference on all issues affecting LDCs.

Special and Differential Treatment

44. We reaffirm that provisions for special and differential treatment are an integral part of the WTO Agreements. We note the concerns expressed regarding their operation in addressing specific constraints faced by developing countries, particularly least-developed countries. In that connection, we also note that some Members have proposed a Framework Agreement on Special and Differential Treatment (WT/GC/W/442). We therefore agree that all special and differential treatment provisions shall be reviewed with a view to strengthening them and making them more precise, effective and operational. In this connection, we endorse the work programme on special and differential treatment set out in the Decision on Implementation-Related Issues and Concerns.

Organization and Management of the Work Programme

45. The negotiations to be pursued under the terms of this Declaration shall be concluded not later than 1 January 2005. The Fifth Session of the Ministerial Conference will take stock of progress in the negotiations, provide any necessary political guidance, and take decisions as necessary. When the results of the negotiations in all areas have been established, a Special Session of the Ministerial Conference will be held to take decisions regarding the adoption and implementation of those results.

46. The overall conduct of the negotiations shall be supervised by a Trade Negotiations Committee under the authority of the General Council. The Trade Negotiations Committee shall hold its first meeting not later than 31 January 2002. It shall establish appropriate negotiating mechanisms as required and supervise the progress of the negotiations.

47. With the exception of the improvements and clarifications of the Dispute Settlement Understanding, the conduct, conclusion and entry into force of the outcome of the negotiations shall be treated as parts of a single undertaking. However, agreements reached at an early stage may be implemented on a provisional or a definitive basis. Early agreements shall be taken into account in assessing the overall balance of the negotiations.

48. Negotiations shall be open to:

(i) all Members of the WTO; and
(ii) States and separate customs territories currently in the process of accession and those that inform Members, at a regular meeting of the General Council, of their intention to negotiate the terms of their membership and for whom an accession working party is established.

Decisions on the outcomes of the negotiations shall be taken only by WTO Members.

49. The negotiations shall be conducted in a transparent manner among participants, in order to facilitate the effective participation of all. They shall be conducted with a view to ensuring benefits to all participants and to achieving an overall balance in the outcome of the negotiations.

50. The negotiations and the other aspects of the Work Programme shall take fully into account the principle of special and differential treatment for developing and least-developed countries embodied in: Part IV of the GATT 1994; the Decision of 28 November 1979 on Differential and More Favourable Treatment, Reciprocity and Fuller Participation of Developing Countries; the Uruguay Round Decision on Measures in Favour of Least-Developed Countries; and all other relevant WTO provisions.

51. The Committee on Trade and Development and the Committee on Trade and Environment shall, within their respective mandates, each act as a forum to identify and debate developmental and environmental aspects of the negotiations, in order to help achieve the objective of having sustainable development appropriately reflected.

52. Those elements of the Work Programme which do not involve negotiations are also accorded a high priority. They shall be pursued under the overall supervision of the General Council, which shall report on progress to the Fifth Session of the Ministerial Conference.

IMPLEMENTATION-RELATED ISSUES AND CONCERNS
Decision of 14 November 2001

The Ministerial Conference,

Having regard to Articles IV.1, IV.5 and IX of the Marrakesh Agreement Establishing the World Trade Organization (WTO);

Mindful of the importance that Members attach to the increased participation of developing countries in the multilateral trading system, and of the need to ensure that the system responds fully to the needs and interests of all participants;

Determined to take concrete action to address issues and concerns that have been raised by many developing-country Members regarding the implementation of some WTO Agreements and Decisions, including the difficulties and resource constraints that have been encountered in the implementation of obligations in various areas;

Recalling the 3 May 2000 Decision of the General Council to meet in special sessions to address outstanding implementation issues, and to assess the existing difficulties, identify ways needed to resolve them, and take decisions for appropriate action not later than the Fourth Session of the Ministerial Conference;

Noting the actions taken by the General Council in pursuance of this mandate at its Special Sessions in October and December 2000 (WT/L/384), as well as the review and further discussion undertaken at the Special Sessions held in April, July and October 2001, including the referral of additional issues to relevant WTO bodies or their chairpersons for further work;

Noting also the reports on the issues referred to the General Council from subsidiary bodies and their chairpersons and from the Director-General, and the discussions as well as the clarifications provided and understandings reached on implementation issues in the intensive informal and formal meetings held under this process since May 2000;

Decides as follows:

1. General Agreement on Tariffs and Trade 1994 (GATT 1994)
   - 1.1 Reaffirms that Article XVIII of the GATT 1994 is a special and differential treatment provision for developing countries and that recourse to it should be less onerous than to Article XII of the GATT 1994.
   - 1.2 Noting the issues raised in the report of the Chairperson of the Committee on Market Access (WT/GC/50) concerning the meaning to be given to the phrase "substantial interest" in paragraph 2(d) of Article XIII of the GATT 1994, the Market Access Committee is directed to give further consideration to the issue and make recommendations to the General Council as expeditiously as possible but in any event not later than the end of 2002.

2. Agreement on Agriculture
   - 2.1 Urges Members to exercise restraint in challenging measures notified under the green box by developing countries to promote rural development and adequately address food security concerns.
   - 2.2 Takes note of the report of the Committee on Agriculture (G/AG/11) regarding the implementation of the Decision on Measures Concerning the Possible Negative Effects of the Reform Programme on Least-Developed and Net Food-Importing Developing Countries, and approves the recommendations contained therein

regarding (i) food aid; (ii) technical and financial assistance in the context of aid programmes to improve agricultural productivity and infrastructure; (iii) financing normal levels of commercial imports of basic foodstuffs; and (iv) review of follow-up.

2.3 Takes note of the report of the Committee on Agriculture (G/AG/11) regarding the implementation of Article 10.2 of the Agreement on Agriculture, and approves the recommendations and reporting requirements contained therein.

2.4 Takes note of the report of the Committee on Agriculture (G/AG/11) regarding the administration of tariff rate quotas and the submission by Members of addenda to their notifications, and endorses the decision by the Committee to keep this matter under review.

3. Agreement on the Application of Sanitary and Phytosanitary Measures

3.1 Where the appropriate level of sanitary and phytosanitary protection allows scope for the phased introduction of new sanitary and phytosanitary measures, the phrase "longer time-frame for compliance" referred to in Article 10.2 of the Agreement on the Application of Sanitary and Phytosanitary Measures, shall be understood to mean normally a period of not less than 6 months. Where the appropriate level of sanitary and phytosanitary protection does not allow scope for the phased introduction of a new measure, but specific problems are identified by a Member, the Member applying the measure shall upon request enter into consultations with the country with a view to finding a mutually satisfactory solution to the problem while continuing to achieve the importing Member's appropriate level of protection.

3.2 Subject to the conditions specified in paragraph 2 of Annex B to the Agreement on the Application of Sanitary and Phytosanitary Measures, the phrase "reasonable interval" shall be understood to mean normally a period of not less than 6 months. It is understood that timeframes for specific measures have to be considered in the context of the particular circumstances of the measure and actions necessary to implement it. The entry into force of measures which contribute to the liberalization of trade should not be unnecessarily delayed.

3.3 Takes note of the Decision of the Committee on Sanitary and Phytosanitary Measures (G/SPS/19) regarding equivalence, and instructs the Committee to develop expeditiously the specific programme to further the implementation of Article 4 of the Agreement on the Application of Sanitary and Phytosanitary Measures.

3.4 Pursuant to the provisions of Article 12.7 of the Agreement on the Application of Sanitary and Phytosanitary Measures, the Committee on Sanitary and Phytosanitary Measures is instructed to review the operation and implementation of the Agreement on Sanitary and Phytosanitary Measures at least once every four years.

3.5 (i) Takes note of the actions taken to date by the Director-General to facilitate the increased participation of Members at different levels of development in the work of the relevant international standard setting organizations as well as his efforts to coordinate with these organizations and financial institutions in identifying SPS-related technical assistance needs and how best to address them; and

(ii) urges the Director-General to continue his cooperative efforts with these organizations and institutions in this regard, including with a view to according priority to the effective participation of least-developed countries and facilitating the provision of technical and financial assistance for this purpose.

3.6 (i) Urges Members to provide, to the extent possible, the financial and technical assistance necessary to enable least-developed countries to respond adequately to the introduction of any new SPS measures which may have significant negative effects on their trade; and

(ii) urges Members to ensure that technical assistance is provided to least-developed countries with a view to responding to the special problems faced by them in implementing the Agreement on the Application of Sanitary and Phytosanitary Measures.

4. Agreement on Textiles and Clothing

Reaffirms the commitment to full and faithful implementation of the Agreement on Textiles and Clothing, and agrees:

4.1 that the provisions of the Agreement relating to the early integration of products and the elimination of quota restrictions should be effectively utilised.

4.2 that Members will exercise particular consideration before initiating investigations in the context of antidumping remedies on textile and clothing exports from developing countries previously subject to quantitative restrictions under the Agreement for a period of two years following full integration of this Agreement into the WTO.

4.3 that without prejudice to their rights and obligations, Members shall notify any changes in their rules of origin concerning products falling under the coverage of the Agreement to the Committee on Rules of Origin which may decide to examine them.

Requests the Council for Trade in Goods to examine the following proposals:

4.4 that when calculating the quota levels for small suppliers for the remaining years of the Agreement, Members will apply the most favourable methodology available in respect of those Members under the growth-on-growth provisions from the beginning of the implementation period; extend the same treatment to least-developed countries; and, where possible, eliminate quota restrictions on imports of such Members;

4.5 that Members will calculate the quota levels for the remaining years of the Agreement with respect to other restrained Members as if implementation of the growth-on-growth provision for stage 3 had been advanced to 1 January 2000;

and make recommendations to the General Council by 31 July 2002 for appropriate action.

5. Agreement on Technical Barriers to Trade

5.1 Confirms the approach to technical assistance being developed by the Committee on Technical Barriers to Trade, reflecting the results of the triennial review work in this area, and mandates this work to continue.

5.2 Subject to the conditions specified in paragraph 12 of Article 2 of the Agreement on Technical Barriers to Trade, the phrase "reasonable interval" shall be understood to mean normally a period of not less than 6 months, except when this would be ineffective in fulfilling the legitimate objectives pursued.

5.3 (i) Takes note of the actions taken to date by the Director-General to facilitate the increased participation of Members at different levels of development in the work of the relevant international standard setting organizations as well as his efforts to coordinate with these organizations and financial institutions in identifying TBT-related technical assistance needs and how best to address them; and

(ii) urges the Director-General to continue his cooperative efforts with these organizations and institutions, including with a view to according priority to the effective participation of least-developed countries and facilitating the provision of technical and financial assistance for this purpose.

5.4 (i) Urges Members to provide, to the extent possible, the financial and technical assistance necessary to enable least-developed countries to respond adequately to the introduction of any new TBT measures which may have significant negative effects on their trade; and

(ii) urges Members to ensure that technical assistance is provided to least-developed countries with a view to responding to the special problems faced by them in implementing the Agreement on Technical Barriers to Trade.

6. Agreement on Trade-Related Investment Measures

6.1 Takes note of the actions taken by the Council for Trade in Goods in regard to requests from some developing-country Members for the extension of the five-year transitional period provided for in Article 5.2 of Agreement on Trade-Related Investment Measures.

6.2 Urges the Council for Trade in Goods to consider positively requests that may be made by least-developed countries under Article 5.3 of the TRIMs Agreement or Article

IX.3 of the WTO Agreement, as well as to take into consideration the particular circumstances of least-developed countries when setting the terms and conditions including time-frames.

7. Agreement on the Implementation of Article VI of the General Agreement on Tariffs and Trade 1994
   - 7.1 Agrees that investigating authorities shall examine with special care any application for the initiation of an anti-dumping investigation where an investigation of the same product from the same Member resulted in a negative finding within the 365 days prior to the filing of the application and that, unless this pre-initiation examination indicates that circumstances have changed, the investigation shall not proceed.
   - 7.2 Recognizes that, while Article 15 of the Agreement on the Implementation of Article VI of the General Agreement on Tariffs and Trade 1994 is a mandatory provision, the modalities for its application would benefit from clarification. Accordingly, the Committee on Anti-Dumping Practices is instructed, through its working group on Implementation, to examine this issue and to draw up appropriate recommendations within twelve months on how to operationalize this provision.
   - 7.3 Takes note that Article 5.8 of the Agreement on the Implementation of Article VI of the General Agreement on Tariffs and Trade 1994 does not specify the time-frame to be used in determining the volume of dumped imports, and that this lack of specificity creates uncertainties in the implementation of the provision. The Committee on Anti-Dumping Practices is instructed, through its working group on Implementation, to study this issue and draw up recommendations within 12 months, with a view to ensuring the maximum possible predictability and objectivity in the application of time frames.
   - 7.4 Takes note that Article 18.6 of the Agreement on the Implementation of Article VI of the General Agreement on Tariffs and Trade 1994 requires the Committee on Anti-Dumping Practices to review annually the implementation and operation of the Agreement taking into account the objectives thereof. The Committee on Anti-dumping Practices is instructed to draw up guidelines for the improvement of annual reviews and to report its views and recommendations to the General Council for subsequent decision within 12 months.

8. Agreement on the Implementation of Article VII of the General Agreement on Tariffs and Trade 1994
   - 8.1 Takes note of the actions taken by the Committee on Customs Valuation in regard to the requests from a number of developing-country Members for the extension of the five-year transitional period provided for in Article 20.1 of Agreement on the Implementation of Article VII of the General Agreement on Tariffs and Trade 1994.
   - 8.2 Urges the Council for Trade in Goods to give positive consideration to requests that may be made by least-developed country Members under paragraphs 1 and 2 of Annex III of the Customs Valuation Agreement or under Article IX.3 of the WTO Agreement, as well as to take into consideration the particular circumstances of least-developed countries when setting the terms and conditions including time-frames.
   - 8.3 Underlines the importance of strengthening cooperation between the customs administrations of Members in the prevention of customs fraud. In this regard, it is agreed that, further to the 1994 Ministerial Decision Regarding Cases Where Customs Administrations Have Reasons to Doubt the Truth or Accuracy of the Declared Value, when the customs administration of an importing Member has reasonable grounds to doubt the truth or accuracy of the declared value, it may seek assistance from the customs administration of an exporting Member on the value of the good concerned. In such cases, the exporting Member shall offer cooperation and assistance, consistent with its domestic laws and procedures, including furnishing information on the export value of the good concerned. Any information provided in this context shall be treated in accordance with Article 10 of the Customs Valuation Agreement. Furthermore, recognizing the legitimate concerns expressed by the customs administrations

of several importing Members on the accuracy of the declared value, the Committee on Customs Valuation is directed to identify and assess practical means to address such concerns, including the exchange of information on export values and to report to the General Council by the end of 2002 at the latest.

9. Agreement on Rules of Origin
   9.1 Takes note of the report of the Committee on Rules of Origin (G/RO/48) regarding progress on the harmonization work programme, and urges the Committee to complete its work by the end of 2001.
   9.2 Agrees that any interim arrangements on rules of origin implemented by Members in the transitional period before the entry into force of the results of the harmonisation work programme shall be consistent with the Agreement on Rules of Origin, particularly Articles 2 and 5 thereof. Without prejudice to Members' rights and obligations, such arrangements may be examined by the Committee on Rules of Origin.

10. Agreement on Subsidies and Countervailing Measures
   10.1 Agrees that Annex VII(b) to the Agreement on Subsidies and Countervailing Measures includes the Members that are listed therein until their GNP per capita reaches US $1,000 in constant 1990 dollars for three consecutive years. This decision will enter into effect upon the adoption by the Committee on Subsidies and Countervailing Measures of an appropriate methodology for calculating constant 1990 dollars. If, however, the Committee on Subsidies and Countervailing Measures does not reach a consensus agreement on an appropriate methodology by 1 January 2003, the methodology proposed by the Chairman of the Committee set forth in G/SCM/38, Appendix 2 shall be applied. A Member shall not leave Annex VII(b) so long as its GNP per capita in current dollars has not reached US $1000 based upon the most recent data from the World Bank.
   10.2 Takes note of the proposal to treat measures implemented by developing countries with a view to achieving legitimate development goals, such as regional growth, technology research and development funding, production diversification and development and implementation of environmentally sound methods of production as non-actionable subsidies, and agrees that this issue be addressed in accordance with paragraph 13 below. During the course of the negotiations, Members are urged to exercise due restraint with respect to challenging such measures.
   10.3 Agrees that the Committee on Subsidies and Countervailing Measures shall continue its review of the provisions of the Agreement on Subsidies and Countervailing Measures regarding countervailing duty investigations and report to the General Council by 31 July 2002.
   10.4 Agrees that if a Member has been excluded from the list in paragraph (b) of Annex VII to the Agreement on Subsidies and Countervailing Measures, it shall be re-included in it when its GNP per capita falls back below US$ 1,000.
   10.5 Subject to the provisions of Articles 27.5 and 27.6, it is reaffirmed that least-developed country Members are exempt from the prohibition on export subsidies set forth in Article 3.1(a) of the Agreement on Subsidies and Countervailing Measures, and thus have flexibility to finance their exporters, consistent with their development needs. It is understood that the eight-year period in Article 27.5 within which a least-developed country Member must phase out its export subsidies in respect of a product in which it is export-competitive begins from the date export competitiveness exists within the meaning of Article 27.6.
   10.6 Having regard to the particular situation of certain developing-country Members, directs the Committee on Subsidies and Countervailing Measures to extend the transition period, under the rubric of Article 27.4 of the Agreement on Subsidies and Countervailing Measures, for certain export subsidies provided by such Members, pursuant to the procedures set forth in document G/SCM/39. Furthermore, when considering a request for an extension of the transition period under the rubric of Article 27.4 of the Agreement on Subsidies and Countervailing Measures, and in

order to avoid that Members at similar stages of development and having a similar order of magnitude of share in world trade are treated differently in terms of receiving such extensions for the same eligible programmes and the length of such extensions, directs the Committee to extend the transition period for those developing countries, after taking into account the relative competitiveness in relation to other developing-country Members who have requested extension of the transition period following the procedures set forth in document G/SCM/39.

11. Agreement on Trade-Related Aspects of Intellectua Property Rights (TRIPS)

11.1 The TRIPS Council is directed to continue its examination of the scope and modalities for complaints of the types provided for under subparagraphs 1(b) and 1(c) of Article XXIII of GATT 1994 and make recommendations to the Fifth Session of the Ministerial Conference. It is agreed that, in the meantime, Members will not initiate such complaints under the TRIPS Agreement.

11.2 Reaffirming that the provisions of Article 66.2 of the TRIPS Agreement are mandatory, it is agreed that the TRIPS Council shall put in place a mechanism for ensuring the monitoring and full implementation of the obligations in question. To this end, developed-country Members shall submit prior to the end of 2002 detailed reports on the functioning in practice of the incentives provided to their enterprises for the transfer of technology in pursuance of their commitments under Article 66.2. These submissions shall be subject to a review in the TRIPS Council and information shall be updated by Members annually.

12. Cross-cutting Issues

12.1 The Committee on Trade and Development is instructed:

(i) to identify those special and differential treatment provisions that are already mandatory in nature and those that are non-binding in character, to consider the legal and practical implications for developed and developing Members of converting special and differential treatment measures into mandatory provisions, to identify those that Members consider should be made mandatory, and to report to the General Council with clear recommendations for a decision by July 2002;

(ii) to examine additional ways in which special and differential treatment provisions can be made more effective, to consider ways, including improved information flows, in which developing countries, in particular the least-developed countries, may be assisted to make best use of special and differential treatment provisions, and to report to the General Council with clear recommendations for a decision by July 2002; and

(iii) to consider, in the context of the work programme adopted at the Fourth Session of the Ministerial Conference, how special and differential treatment may be incorporated into the architecture of WTO rules.

The work of the Committee on Trade and Development in this regard shall take fully into consideration previous work undertaken as noted in WT/COMTD/W/77/Rev.1. It will also be without prejudice to work in respect of implementation of WTO Agreements in the General Council and in other Councils and Committees.

12.2 Reaffirms that preferences granted to developing countries pursuant to the Decision of the Contracting Parties of 28 November 1979 ("Enabling Clause")[1] should be generalised, non-reciprocal and non-discriminatory.

13. Outstanding Implementation Issues[2]

Agrees that outstanding implementation issues be addressed in accordance with paragraph 12 of the Ministerial Declaration (WT/MIN(01)/DEC/1).

[1] BISD 26S/203.

[2] A list of these issues is compiled in document Job(01)/152/Rev.1.

14. Final Provisions

Requests the Director-General, consistent with paragraphs 38 to 43 of the Ministerial Declaration (WT/MIN(01)/DEC/1), to ensure that WTO technical assistance focuses, on a priority basis, on assisting developing countries to implement existing WTO obligations as well as on increasing their capacity to participate more effectively in future multilateral trade negotiations. In carrying out this mandate, the WTO Secretariat should cooperate more closely with international and regional intergovernmental organisations so as to increase efficiency and synergies and avoid duplication of programmes.

TRIPS DECLARATION
DECLARATION ON THE TRIPS AGREEMENT AND PUBLIC HEALTH
Adopted on 14 November 2001

1. We recognize the gravity of the public health problems afflicting many developing and least-developed countries, especially those resulting from HIV/AIDS, tuberculosis, malaria and other epidemics.

2. We stress the need for the WTO Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS Agreement) to be part of the wider national and international action to address these problems.

3. We recognize that intellectual property protection is important for the development of new medicines. We also recognize the concerns about its effects on prices.

4. We agree that the TRIPS Agreement does not and should not prevent Members from taking measures to protect public health. Accordingly, while reiterating our commitment to the TRIPS Agreement, we affirm that the Agreement can and should be interpreted and implemented in a manner supportive of WTO Members' right to protect public health and, in particular, to promote access to medicines for all.

In this connection, we reaffirm the right of WTO Members to use, to the full, the provisions in the TRIPS Agreement, which provide flexibility for this purpose.

5. Accordingly and in the light of paragraph 4 above, while maintaining our commitments in the TRIPS Agreement, we recognize that these flexibilities include:

(a) In applying the customary rules of interpretation of public international law, each provision of the TRIPS Agreement shall be read in the light of the object and purpose of the Agreement as expressed, in particular, in its objectives and principles.

(b) Each Member has the right to grant compulsory licences and the freedom to determine the grounds upon which such licences are granted.

(c) Each Member has the right to determine what constitutes a national emergency or other circumstances of extreme urgency, it being understood that public health crises, including those relating to HIV/AIDS, tuberculosis, malaria and other epidemics, can represent a national emergency or other circumstances of extreme urgency.

(d) The effect of the provisions in the TRIPS Agreement that are relevant to the exhaustion of intellectual property rights is to leave each Member free to establish its own regime for such exhaustion without challenge, subject to the MFN and national treatment provisions of Articles 3 and 4.

6. We recognize that WTO Members with insufficient or no manufacturing capacities in the pharmaceutical sector could face difficulties in making effective use of compulsory licensing under the TRIPS Agreement. We instruct the Council for TRIPS to find an expeditious solution to this problem and to report to the General Council before the end of 2002.

7. We reaffirm the commitment of developed-country Members to provide incentives to their enterprises and institutions to promote and encourage technology transfer to

least-developed country Members pursuant to Article 66.2. We also agree that the least-developed country Members will not be obliged, with respect to pharmaceutical products, to implement or apply Sections 5 and 7 of Part II of the TRIPS Agreement or to enforce rights provided for under these Sections until 1 January 2016, without prejudice to the right of least-developed country Members to seek other extensions of the transition periods as provided for in Article 66.1 of the TRIPS Agreement. We instruct the Council for TRIPS to take the necessary action to give effect to this pursuant to Article 66.1 of the TRIPS Agreement.

CANCÚN MINISTERIAL STATEMENT
Adopted on 14 September 2003

1. As we conclude our Fifth Ministerial Conference in Cancún, we would like to express our deep appreciation to the Government and people of Mexico for the excellent organization and warm hospitality we have received in Cancún.

2. At this meeting we have welcomed Cambodia and Nepal as the first least-developed countries to accede to the WTO since its establishment.

3. All participants have worked hard and constructively to make progress as required under the Doha mandates. We have, indeed, made considerable progress. However, more work needs to be done in some key areas to enable us to proceed towards the conclusion of the negotiations in fulfilment of the commitments we took at Doha.

4. We therefore instruct our officials to continue working on outstanding issues with a renewed sense of urgency and purpose and taking fully into account all the views we have expressed in this Conference. We ask the Chairman of the General Council, working in close co-operation with the Director-General, to coordinate this work and to convene a meeting of the General Council at Senior Officials level no later than 15 December 2003 to take the action necessary at that stage to enable us to move towards a successful and timely conclusion of the negotiations. We shall continue to exercise close personal supervision of this process.

5. We will bring with us into this new phase all the valuable work that has been done at this Conference. In those areas where we have reached a high level of convergence on texts, we undertake to maintain this convergence while working for an acceptable overall outcome.

6. Notwithstanding this setback, we reaffirm all our Doha Declarations and Decisions and recommit ourselves to working to implement them fully and faithfully.

DOHA WORK PROGRAMME
Decision Adopted by the General Council on 1 August 2004

1. The General Council reaffirms the Ministerial Declarations and Decisions adopted at Doha and the full commitment of all Members to give effect to them. The Council emphasizes Members' resolve to complete the Doha Work Programme fully and to conclude successfully the negotiations launched at Doha. Taking into account the Ministerial Statement adopted at Cancún on 14 September 2003, and the statements by the Council Chairman and the Director-General at the Council meeting of 15–16 December 2003, the Council takes note of the report by the Chairman of the Trade Negotiations Committee (TNC) and agrees to take action as follows:

a. *Agriculture*: the General Council adopts the framework set out in Annex A to this document.

b. *Cotton*: the General Council reaffirms the importance of the Sectoral Initiative on Cotton and takes note of the parameters set out in Annex A within which the trade-related aspects of this issue will be pursued in the agriculture negotiations. The General Council also attaches importance to the development aspects of the Cotton Initiative and wishes to stress the complementarity between the trade and development aspects. The Council takes note of the recent Workshop on Cotton in Cotonou on 23–24 March 2004 organized by the WTO Secretariat, and other bilateral and multilateral efforts to make progress on the development assistance aspects and instructs the Secretariat to continue to work with the development community and to provide the Council with periodic reports on relevant developments.

Members should work on related issues of development multilaterally with the international financial institutions, continue their bilateral programmes, and all developed countries are urged to participate. In this regard, the General Council instructs the Director General to consult with the relevant international organizations, including the Bretton Woods Institutions, the Food and Agriculture Organization and the International Trade Centre to direct effectively existing programmes and any additional resources towards development of the economies where cotton has vital importance.

c. *Non-agricultural Market Access*: the General Council adopts the framework set out in Annex B to this document.

d. *Development*:
Principles: development concerns form an integral part of the Doha Ministerial Declaration. The General Council rededicates and recommits Members to fulfilling the development dimension of the Doha Development Agenda, which places the needs and interests of developing and least-developed countries at the heart of the Doha Work Programme. The Council reiterates the important role that enhanced market access, balanced rules, and well targeted, sustainably financed technical assistance and capacity building programmes can play in the economic development of these countries.

Special and Differential Treatment: the General Council reaffirms that provisions for special and differential (S&D) treatment are an integral part of the WTO Agreements. The Council recalls Ministers' decision in Doha to review all S&D treatment provisions with a view to strengthening them and making them more precise, effective and operational.

The Council recognizes the progress that has been made so far. The Council instructs the Committee on Trade and Development in Special Session to expeditiously complete the review of all the outstanding Agreement-specific proposals and report to the General Council, with clear recommendations for a decision, by July 2005. The Council further instructs the Committee, within the parameters of the Doha mandate, to address all other outstanding work, including on the cross-cutting issues, the monitoring mechanism and the incorporation of S&D treatment into the architecture of WTO rules, as referred to in TN/CTD/7 and report, as appropriate, to the General Council.

The Council also instructs all WTO bodies to which proposals in Category II have been referred to expeditiously complete the consideration of these proposals and report to the General Council, with clear recommendations for a decision, as soon as possible and no later than July 2005. In doing so these bodies will ensure that, as far as possible, their meetings do not overlap so as to enable full and effective participation of developing countries in these discussions.

Technical Assistance: the General Council recognizes the progress that has been made since the Doha Ministerial Conference in expanding Trade-Related Technical Assistance (TRTA) to developing countries and low-income countries in transition. In furthering this effort the Council affirms that such countries, and in particular least-developed countries, should be provided with enhanced TRTA and capacity building, to increase their effective participation in the negotiations, to facilitate their implementation of WTO rules, and to enable them to adjust and diversify their economies. In this context the Council welcomes and further encourages the improved coordination with other agencies, including under the Integrated Framework for TRTA for the LDCs (IF) and the Joint Integrated Technical Assistance Programme (JITAP).

Implementation: concerning implementation-related issues, the General Council reaffirms the mandates Ministers gave in paragraph 12 of the Doha Ministerial Declaration and the Doha Decision on Implementation-Related Issues and Concerns, and renews Members' determination to find appropriate solutions to outstanding issues. The Council instructs the Trade Negotiations Committee, negotiating bodies and other WTO bodies concerned to redouble their efforts to find appropriate solutions as a priority. Without prejudice to the positions of Members, the Council requests the Director-General to continue with his consultative process on all outstanding implementation issues under paragraph 12(b) of the Doha Ministerial Declaration, including on issues related to the extension of the protection of geographical indications provided for in Article 23 of the TRIPS Agreement to products other than wines and spirits, if need be by appointing Chairpersons of concerned WTO bodies as his Friends and/or by holding dedicated consultations. The Director-General shall report to the TNC and the General Council no later than May 2005. The Council shall review progress and take any appropriate action no later than July 2005.

Other Development Issues: in the ongoing market access negotiations, recognising the fundamental principles of the WTO and relevant provisions of GATT 1994, special attention shall be given to the specific trade and development related needs and concerns of developing countries, including capacity constraints. These particular concerns of developing countries, including relating to food security, rural development, livelihood, preferences, commodities and net food imports, as well as prior unilateral liberalisation, should be taken into consideration, as appropriate, in the course of the Agriculture and NAMA negotiations. The trade-related issues identified for the fuller integration of small, vulnerable economies into the multilateral trading system, should also be addressed, without creating a sub-category of Members, as part of a work programme, as mandated in paragraph 35 of the Doha Ministerial Declaration.

Least-Developed Countries: the General Council reaffirms the commitments made at Doha concerning least-developed countries and renews its determination to fulfil these commitments. Members will continue to take due account of the concerns of

least-developed countries in the negotiations. The Council confirms that nothing in this Decision shall detract in any way from the special provisions agreed by Members in respect of these countries.

e. Services: the General Council takes note of the report to the TNC by the Special Session of the Council for Trade in Services[1] and reaffirms Members' commitment to progress in this area of the negotiations in line with the Doha mandate. The Council adopts the recommendations agreed by the Special Session, set out in Annex C to this document, on the basis of which further progress in the services negotiations will be pursued. Revised offers should be tabled by May 2005.

f. Other negotiating bodies:
Rules, Trade & Environment and TRIPS: the General Council takes note of the reports to the TNC by the Negotiating Group on Rules and by the Special Sessions of the Committee on Trade and Environment and the TRIPS Council.[2] The Council reaffirms Members' commitment to progress in all of these areas of the negotiations in line with the Doha mandates.

Dispute Settlement: the General Council takes note of the report to the TNC by the Special Session of the Dispute Settlement Body[3] and reaffirms Members' commitment to progress in this area of the negotiations in line with the Doha mandate. The Council adopts the TNC's recommendation that work in the Special Session should continue on the basis set out by the Chairman of that body in his report to the TNC.

g. Trade Facilitation: taking note of the work done on trade facilitation by the Council for Trade in Goods under the mandate in paragraph 27 of the Doha Ministerial Declaration and the work carried out under the auspices of the General Council both prior to the Fifth Ministerial Conference and after its conclusion, the General Council decides by explicit consensus to commence negotiations on the basis of the modalities set out in Annex D to this document.

Relationship between Trade and Investment, Interaction between Trade and Competition Policy and Transparency in Government Procurement: the Council agrees that these issues, mentioned in the Doha Ministerial Declaration in paragraphs 20–22, 23–25 and 26 respectively, will not form part of the Work Programme set out in that Declaration and therefore no work towards negotiations on any of these issues will take place within the WTO during the Doha Round.

h. Other elements of the Work Programme: the General Council reaffirms the high priority Ministers at Doha gave to those elements of the Work Programme which do not involve negotiations. Noting that a number of these issues are of particular interest to developing-country Members, the Council emphasizes its commitment to fulfil the mandates given by Ministers in all these areas. To this end, the General Council and other relevant bodies shall report in line with their Doha mandates to the Sixth Session of the Ministerial Conference. The moratoria covered by paragraph 11.1 of the Doha Ministerial Decision on Implementation-related Issues and Concerns and paragraph 34 of the Doha Ministerial Declaration are extended up to the Sixth Ministerial Conference.

2. The General Council agrees that this Decision and its Annexes shall not be used in any dispute settlement proceeding under the DSU and shall not be used for interpreting the existing WTO Agreements.

[1] This report is contained in document TN/S/16.
[2] The reports to the TNC referenced in this paragraph are contained in the following documents: Negotiating Group on Rules—TN/RL/9; Special Session of the Committee on Trade and Environment—TN/TE/9; Special Session of the Council for TRIPS—TN/IP/10.
[3] This report is contained in document TN/DS/10.

3. The General Council calls on all Members to redouble their efforts towards the conclusion of a balanced overall outcome of the Doha Development Agenda in fulfilment of the commitments Ministers took at Doha. The Council agrees to continue the negotiations launched at Doha beyond the timeframe set out in paragraph 45 of the Doha Declaration, leading to the Sixth Session of the Ministerial Conference. Recalling its decision of 21 October 2003 to accept the generous offer of the Government of Hong Kong, China to host the Sixth Session, the Council further agrees that this Session will be held in December 2005.

ANNEX A

FRAMEWORK FOR ESTABLISHING MODALITIES IN AGRICULTURE

1. The starting point for the current phase of the agriculture negotiations has been the mandate set out in Paragraph 13 of the Doha Ministerial Declaration. This in turn built on the long-term objective of the Agreement on Agriculture to establish a fair and market-oriented trading system through a programme of fundamental reform. The elements below offer the additional precision required at this stage of the negotiations and thus the basis for the negotiations of full modalities in the next phase. The level of ambition set by the Doha mandate will continue to be the basis for the negotiations on agriculture.

2. The final balance will be found only at the conclusion of these subsequent negotiations and within the Single Undertaking. To achieve this balance, the modalities to be developed will need to incorporate operationally effective and meaningful provisions for special and differential treatment for developing country Members. Agriculture is of critical importance to the economic development of developing country Members and they must be able to pursue agricultural policies that are supportive of their development goals, poverty reduction strategies, food security and livelihood concerns. Non-trade concerns, as referred to in Paragraph 13 of the Doha Declaration, will be taken into account.

3. The reforms in all three pillars form an interconnected whole and must be approached in a balanced and equitable manner.

4. The General Council recognizes the importance of cotton for a certain number of countries and its vital importance for developing countries, especially LDCs. It will be addressed ambitiously, expeditiously, and specifically, within the agriculture negotiations. The provisions of this framework provide a basis for this approach, as does the sectoral initiative on cotton. The Special Session of the Committee on Agriculture shall ensure appropriate prioritization of the cotton issue independently from other sectoral initiatives. A subcommittee on cotton will meet periodically and report to the Special Session of the Committee on Agriculture to review progress. Work shall encompass all trade-distorting policies affecting the sector in all three pillars of market access, domestic support, and export competition, as specified in the Doha text and this Framework text.

5. Coherence between trade and development aspects of the cotton issue will be pursued as set out in paragraph 1.b of the text to which this Framework is annexed.

DOMESTIC SUPPORT

6. The Doha Ministerial Declaration calls for "substantial reductions in trade-distorting domestic support". With a view to achieving these substantial reductions, the negotiations in this pillar will ensure the following:

- Special and differential treatment remains an integral component of domestic support. Modalities to be developed will include longer implementation periods and lower reduction coefficients for all types of trade-distorting domestic support and continued access to the provisions under Article 6.2.

- There will be a strong element of harmonisation in the reductions made by developed Members. Specifically, higher levels of permitted trade-distorting domestic support will be subject to deeper cuts.
- Each such Member will make a substantial reduction in the overall level of its trade-distorting support from bound levels.
- As well as this overall commitment, Final Bound Total AMS and permitted *de minimis* levels will be subject to substantial reductions and, in the case of the Blue Box, will be capped as specified in paragraph 15 in order to ensure results that are coherent with the long-term reform objective. Any clarification or development of rules and conditions to govern trade distorting support will take this into account.

Overall Reduction: A Tiered Formula

7. The overall base level of all trade-distorting domestic support, as measured by the Final Bound Total AMS plus permitted *de minimis* level and the level agreed in paragraph 8 below for Blue Box payments, will be reduced according to a tiered formula. Under this formula, Members having higher levels of trade-distorting domestic support will make greater overall reductions in order to achieve a harmonizing result. As the first instalment of the overall cut, in the first year and throughout the implementation period, the sum of all trade-distorting support will not exceed 80 per cent of the sum of Final Bound Total AMS plus permitted *de minimis* plus the Blue Box at the level determined in paragraph 15.

8. The following parameters will guide the further negotiation of this tiered formula:

- This commitment will apply as a minimum overall commitment. It will not be applied as a ceiling on reductions of overall trade-distorting domestic support, should the separate and complementary formulae to be developed for Total AMS, *de minimis* and Blue Box payments imply, when taken together, a deeper cut in overall trade-distorting domestic support for an individual Member.
- The base for measuring the Blue Box component will be the higher of existing Blue Box payments during a recent representative period to be agreed and the cap established in paragraph 15 below.

Final Bound Total AMS: A Tiered Formula

9. To achieve reductions with a harmonizing effect:

- Final Bound Total AMS will be reduced substantially, using a tiered approach.
- Members having higher Total AMS will make greater reductions.
- To prevent circumvention of the objective of the Agreement through transfers of unchanged domestic support between different support categories, product-specific AMSs will be capped at their respective average levels according to a methodology to be agreed.
- Substantial reductions in Final Bound Total AMS will result in reductions of some product-specific support.

10. Members may make greater than formula reductions in order to achieve the required level of cut in overall trade-distorting domestic support.

De Minimis

11. Reductions in *de minimis* will be negotiated taking into account the principle of special and differential treatment. Developing countries that allocate almost all *de minimis* support for subsistence and resource-poor farmers will be exempt.

12. Members may make greater than formula reductions in order to achieve the required level of cut in overall trade-distorting domestic support.

Blue Box

13. Members recognize the role of the Blue Box in promoting agricultural reforms. In this light, Article 6.5 will be reviewed so that Members may have recourse to the following measures:

- Direct payments under production-limiting programmes if:
  — such payments are based on fixed and unchanging areas and yields; or
  — such payments are made on 85% or less of a fixed and unchanging base level of production; or
  — livestock payments are made on a fixed and unchanging number of head.

Or

- Direct payments that do not require production if:
  — such payments are based on fixed and unchanging bases and yields; or
  — livestock payments made on a fixed and unchanging number of head; and
  — such payments are made on 85% or less of a fixed and unchanging base level of production.

14. The above criteria, along with additional criteria will be negotiated. Any such criteria will ensure that Blue Box payments are less trade-distorting than AMS measures, it being understood that:

- Any new criteria would need to take account of the balance of WTO rights and obligations.
- Any new criteria to be agreed will not have the perverse effect of undoing ongoing reforms.

15. Blue Box support will not exceed 5% of a Member's average total value of agricultural production during an historical period. The historical period will be established in the negotiations. This ceiling will apply to any actual or potential Blue Box user from the beginning of the implementation period. In cases where a Member has placed an exceptionally large percentage of its trade-distorting support in the Blue Box, some flexibility will be provided on a basis to be agreed to ensure that such a Member is not called upon to make a wholly disproportionate cut.

Green Box

16. Green Box criteria will be reviewed and clarified with a view to ensuring that Green Box measures have no, or at most minimal, trade-distorting effects or effects on production. Such a review and clarification will need to ensure that the basic concepts, principles and effectiveness of the Green Box remain and take due account of non-trade concerns. The improved obligations for monitoring and surveillance of all new disciplines foreshadowed in paragraph 48 below will be particularly important with respect to the Green Box.

EXPORT COMPETITION

17. The Doha Ministerial Declaration calls for "reduction of, with a view to phasing out, all forms of export subsidies". As an outcome of the negotiations, Members agree

to establish detailed modalities ensuring the parallel elimination of all forms of export subsidies and disciplines on all export measures with equivalent effect by a credible end date.

End Point

18. The following will be eliminated by the end date to be agreed:

- Export subsidies as scheduled.
- Export credits, export credit guarantees or insurance programmes with repayment periods beyond 180 days.
- Terms and conditions relating to export credits, export credit guarantees or insurance programmes with repayment periods of 180 days and below which are not in accordance with disciplines to be agreed. These disciplines will cover, *inter alia*, payment of interest, minimum interest rates, minimum premium requirements, and other elements which can constitute subsidies or otherwise distort trade.
- Trade distorting practices with respect to exporting STEs including eliminating export subsidies provided to or by them, government financing, and the underwriting of losses. The issue of the future use of monopoly powers will be subject to further negotiation.
- Provision of food aid that is not in conformity with operationally effective disciplines to be agreed. The objective of such disciplines will be to prevent commercial displacement. The role of international organizations as regards the provision of food aid by Members, including related humanitarian and developmental issues, will be addressed in the negotiations. The question of providing food aid exclusively in fully grant form will also be addressed in the negotiations.

19. Effective transparency provisions for paragraph 18 will be established. Such provisions, in accordance with standard WTO practice, will be consistent with commercial confidentiality considerations.

Implementation

20. Commitments and disciplines in paragraph 18 will be implemented according to a schedule and modalities to be agreed. Commitments will be implemented by annual instalments. Their phasing will take into account the need for some coherence with internal reform steps of Members.

21. The negotiation of the elements in paragraph 18 and their implementation will ensure equivalent and parallel commitments by Members.

Special and Differential Treatment

22. Developing country Members will benefit from longer implementation periods for the phasing out of all forms of export subsidies.

23. Developing countries will continue to benefit from special and differential treatment under the provisions of Article 9.4 of the Agreement on Agriculture for a reasonable period, to be negotiated, after the phasing out of all forms of export subsidies and implementation of all disciplines identified above are completed.

24. Members will ensure that the disciplines on export credits, export credit guarantees or insurance programs to be agreed will make appropriate provision for differential treatment in favour of least-developed and net food-importing developing countries as provided for in paragraph 4 of the Decision on Measures Concerning the Possible Negative Effects of the Reform Programme on Least-Developed and Net Food-Importing

Developing Countries. Improved obligations for monitoring and surveillance of all new disciplines as foreshadowed in paragraph 48 will be critically important in this regard. Provisions to be agreed in this respect must not undermine the commitments undertaken by Members under the obligations in paragraph 18 above.

25. STEs in developing country Members which enjoy special privileges to preserve domestic consumer price stability and to ensure food security will receive special consideration for maintaining monopoly status.

Special Circumstances

26. In exceptional circumstances, which cannot be adequately covered by food aid, commercial export credits or preferential international financing facilities, ad hoc temporary financing arrangements relating to exports to developing countries may be agreed by Members. Such agreements must not have the effect of undermining commitments undertaken by Members in paragraph 18 above, and will be based on criteria and consultation procedures to be established.

MARKET ACCESS

27. The Doha Ministerial Declaration calls for "substantial improvements in market access". Members also agreed that special and differential treatment for developing Members would be an integral part of all elements in the negotiations.

The Single Approach: a Tiered Formula

28. To ensure that a single approach for developed and developing country Members meets all the objectives of the Doha mandate, tariff reductions will be made through a tiered formula that takes into account their different tariff structures.

29. To ensure that such a formula will lead to substantial trade expansion, the following principles will guide its further negotiation:

- Tariff reductions will be made from bound rates. Substantial overall tariff reductions will be achieved as a final result from negotiations.
- Each Member (other than LDCs) will make a contribution. Operationally effective special and differential provisions for developing country Members will be an integral part of all elements.
- Progressivity in tariff reductions will be achieved through deeper cuts in higher tariffs with flexibilities for sensitive products. Substantial improvements in market access will be achieved for all products.

30. The number of bands, the thresholds for defining the bands and the type of tariff reduction in each band remain under negotiation. The role of a tariff cap in a tiered formula with distinct treatment for sensitive products will be further evaluated.

Sensitive Products

Selection

31. Without undermining the overall objective of the tiered approach, Members may designate an appropriate number, to be negotiated, of tariff lines to be treated as sensitive, taking account of existing commitments for these products.

Treatment

32. The principle of 'substantial improvement' will apply to each product.

33. 'Substantial improvement' will be achieved through combinations of tariff quota commitments and tariff reductions applying to each product. However, balance in this negotiation will be found only if the final negotiated result also reflects the sensitivity of the product concerned.

34. Some MFN-based tariff quota expansion will be required for all such products. A base for such an expansion will be established, taking account of coherent and equitable criteria to be developed in the negotiations. In order not to undermine the objective of the tiered approach, for all such products, MFN based tariff quota expansion will be provided under specific rules to be negotiated taking into account deviations from the tariff formula.

Other Elements

35. Other elements that will give the flexibility required to reach a final balanced result include reduction or elimination of in-quota tariff rates**,** and operationally effective improvements in tariff quota administration for existing tariff quotas so as to enable Members, and particularly developing country Members, to fully benefit from the market access opportunities under tariff rate quotas.

36. Tariff escalation will be addressed through a formula to be agreed.

37. The issue of tariff simplification remains under negotiation.

38. The question of the special agricultural safeguard (SSG) remains under negotiation.

Special and differential treatment

39. Having regard to their rural development, food security and/or livelihood security needs, special and differential treatment for developing countries will be an integral part of all elements of the negotiation, including the tariff reduction formula, the number and treatment of sensitive products, expansion of tariff rate quotas, and implementation period.

40. Proportionality will be achieved by requiring lesser tariff reduction commitments or tariff quota expansion commitments from developing country Members.

41. Developing country Members will have the flexibility to designate an appropriate number of products as Special Products, based on criteria of food security, livelihood security and rural development needs. These products will be eligible for more flexible treatment. The criteria and treatment of these products will be further specified during the negotiation phase and will recognize the fundamental importance of Special Products to developing countries.

42. A Special Safeguard Mechanism (SSM) will be established for use by developing country Members.

43. Full implementation of the long-standing commitment to achieve the fullest liberalisation of trade in tropical agricultural products and for products of particular importance to the diversification of production from the growing of illicit narcotic crops is overdue and will be addressed effectively in the market access negotiations.

44. The importance of long-standing preferences is fully recognised. The issue of preference erosion will be addressed. For the further consideration in this regard, paragraph 16 and other relevant provisions of TN/AG/W/1/Rev.1 will be used as a reference.

LEAST- DEVELOPED COUNTRIES

45. Least-Developed Countries, which will have full access to all special and differential treatment provisions above, are not required to undertake reduction commitments. Developed Members, and developing country Members in a position to do so, should provide duty-free and quota-free market access for products originating from least-developed countries.

46. Work on cotton under all the pillars will reflect the vital importance of this sector to certain LDC Members and we will work to achieve ambitious results expeditiously.

RECENTLY ACCEDED MEMBERS

47. The particular concerns of recently acceded Members will be effectively addressed through specific flexibility provisions.

MONITORING AND SURVEILLANCE

48. Article 18 of the Agreement on Agriculture will be amended with a view to enhancing monitoring so as to effectively ensure full transparency, including through timely and complete notifications with respect to the commitments in market access, domestic support and export competition. The particular concerns of developing countries in this regard will be addressed.

OTHER ISSUES

49. Issues of interest but not agreed: sectoral initiatives, differential export taxes, GIs.

50. Disciplines on export prohibitions and restrictions in Article 12.1 of the Agreement on Agriculture will be strengthened.

ANNEX B

FRAMEWORK FOR ESTABLISHING MODALITIES IN MARKET ACCESS FOR NON-AGRICULTURAL PRODUCTS

1. This Framework contains the initial elements for future work on modalities by the Negotiating Group on Market Access. Additional negotiations are required to reach agreement on the specifics of some of these elements. These relate to the formula, the issues concerning the treatment of unbound tariffs in indent two of paragraph 5, the flexibilities for developing-country participants, the issue of participation in the sectorial tariff component and the preferences. In order to finalize the modalities, the Negotiating Group is instructed to address these issues expeditiously in a manner consistent with the mandate of paragraph 16 of the Doha Ministerial Declaration and the overall balance therein.

2. We reaffirm that negotiations on market access for non-agricultural products shall aim to reduce or as appropriate eliminate tariffs, including the reduction or elimination of tariff peaks, high tariffs, and tariff escalation, as well as non-tariff barriers, in particular on products of export interest to developing countries. We also reaffirm the importance of special and differential treatment and less than full reciprocity in reduction commitments as integral parts of the modalities.

3. We acknowledge the substantial work undertaken by the Negotiating Group on Market Access and the progress towards achieving an agreement on negotiating modalities. We take note of the constructive dialogue on the Chair's Draft Elements of Modalities (TN/MA/W/35/Rev.1) and confirm our intention to use this document as a reference for the future work of the Negotiating Group. We instruct the Negotiating Group to continue its work, as mandated by paragraph 16 of the Doha Ministerial Declaration with its corresponding references to the relevant provisions of Article XXVIII *bis* of GATT 1994 and to the provisions cited in paragraph 50 of the Doha Ministerial Declaration, on the basis set out below.

4. We recognize that a formula approach is key to reducing tariffs, and reducing or eliminating tariff peaks, high tariffs, and tariff escalation. We agree that the Negotiating Group should continue its work on a non-linear formula applied on a line-by-line basis which shall take fully into account the special needs and interests of developing and least-developed country participants, including through less than full reciprocity in reduction commitments.

5. We further agree on the following elements regarding the formula:

- product coverage shall be comprehensive without *a priori* exclusions;
- tariff reductions or elimination shall commence from the bound rates after full implementation of current concessions; however, for unbound tariff lines, the basis for commencing the tariff reductions shall be [two] times the MFN applied rate in the base year;
- the base year for MFN applied tariff rates shall be 2001 (applicable rates on 14 November);
- credit shall be given for autonomous liberalization by developing countries provided that the tariff lines were bound on an MFN basis in the WTO since the conclusion of the Uruguay Round;

— all non-*ad valorem* duties shall be converted to *ad valorem* equivalents on the basis of a methodology to be determined and bound in *ad valorem* terms;
— negotiations shall commence on the basis of the HS96 or HS2002 nomenclature, with the results of the negotiations to be finalized in HS2002 nomenclature;
— the reference period for import data shall be 1999–2001.

6. We furthermore agree that, as an exception, participants with a binding coverage of non-agricultural tariff lines of less than [35] percent would be exempt from making tariff reductions through the formula. Instead, we expect them to bind [100] percent of non-agricultural tariff lines at an average level that does not exceed the overall average of bound tariffs for all developing countries after full implementation of current concessions.

7. We recognize that a sectorial tariff component, aiming at elimination or harmonization is another key element to achieving the objectives of paragraph 16 of the Doha Ministerial Declaration with regard to the reduction or elimination of tariffs, in particular on products of export interest to developing countries. We recognize that participation by all participants will be important to that effect. We therefore instruct the Negotiating Group to pursue its discussions on such a component, with a view to defining product coverage, participation, and adequate provisions of flexibility for developing-country participants.

8. We agree that developing-country participants shall have longer implementation periods for tariff reductions. In addition, they shall be given the following flexibility:

a) applying less than formula cuts to up to [10] percent of the tariff lines provided that the cuts are no less than half the formula cuts and that these tariff lines do not exceed [10] percent of the total value of a Member's imports; or
b) keeping, as an exception, tariff lines unbound, or not applying formula cuts for up to [5] percent of tariff lines provided they do not exceed [5] percent of the total value of a Member's imports.

We furthermore agree that this flexibility could not be used to exclude entire HS Chapters.

9. We agree that least-developed country participants shall not be required to apply the formula nor participate in the sectorial approach, however, as part of their contribution to this round of negotiations, they are expected to substantially increase their level of binding commitments.

10. Furthermore, in recognition of the need to enhance the integration of least-developed countries into the multilateral trading system and support the diversification of their production and export base, we call upon developed-country participants and other participants who so decide, to grant on an autonomous basis duty-free and quota-free market access for non-agricultural products originating from least-developed countries by the year [. . .].

11. We recognize that newly acceded Members shall have recourse to special provisions for tariff reductions in order to take into account their extensive market access commitments undertaken as part of their accession and that staged tariff reductions are still being implemented in many cases. We instruct the Negotiating Group to further elaborate on such provisions.

12. We agree that pending agreement on core modalities for tariffs, the possibilities of supplementary modalities such as zero-for-zero sector elimination, sectorial harmonization, and request & offer, should be kept open.

13. In addition, we ask developed-country participants and other participants who so decide to consider the elimination of low duties.

14. We recognize that NTBs are an integral and equally important part of these negotiations and instruct participants to intensify their work on NTBs. In particular, we encourage all participants to make notifications on NTBs by 31 October 2004 and to proceed with identification, examination, categorization, and ultimately negotiations on NTBs. We take note that the modalities for addressing NTBs in these negotiations could include request/offer, horizontal, or vertical approaches; and should fully take into account the principle of special and differential treatment for developing and least-developed country participants.

15. We recognize that appropriate studies and capacity building measures shall be an integral part of the modalities to be agreed. We also recognize the work that has already been undertaken in these areas and ask participants to continue to identify such issues to improve participation in the negotiations.

16. We recognize the challenges that may be faced by non-reciprocal preference beneficiary Members and those Members that are at present highly dependent on tariff revenue as a result of these negotiations on non-agricultural products. We instruct the Negotiating Group to take into consideration, in the course of its work, the particular needs that may arise for the Members concerned.

17. We furthermore encourage the Negotiating Group to work closely with the Committee on Trade and Environment in Special Session with a view to addressing the issue of non-agricultural environmental goods covered in paragraph 31 (iii) of the Doha Ministerial Declaration.

ANNEX C

RECOMMENDATIONS OF THE SPECIAL SESSION OF THE COUNCIL FOR TRADE IN SERVICES

(a) Members who have not yet submitted their initial offers must do so as soon as possible.
(b) A date for the submission of a round of revised offers should be established as soon as feasible.
(c) With a view to providing effective market access to all Members and in order to ensure a substantive outcome, Members shall strive to ensure a high quality of offers, particularly in sectors and modes of supply of export interest to developing countries, with special attention to be given to least-developed countries.
(d) Members shall aim to achieve progressively higher levels of liberalization with no a priori exclusion of any service sector or mode of supply and shall give special attention to sectors and modes of supply of export interest to developing countries. Members note the interest of developing countries, as well as other Members, in Mode 4.
(e) Members must intensify their efforts to conclude the negotiations on rule-making under GATS Articles VI:4, X, XIII and XV in accordance with their respective mandates and deadlines.
(f) Targeted technical assistance should be provided with a view to enabling developing countries to participate effectively in the negotiations.
(g) For the purpose of the Sixth Ministerial meeting, the Special Session of the Council for Trade in Services shall review progress in these negotiations and provide a full report to the Trade Negotiations Committee, including possible recommendations.

ANNEX D

MODALITIES FOR NEGOTIATIONS ON TRADE FACILITATION

1. Negotiations shall aim to clarify and improve relevant aspects of Articles V, VIII and X of the GATT 1994 with a view to further expediting the movement, release and clearance of goods, including goods in transit.[4] Negotiations shall also aim at enhancing technical assistance and support for capacity building in this area. The negotiations shall further aim at provisions for effective cooperation between customs or any other appropriate authorities on trade facilitation and customs compliance issues.

2. The results of the negotiations shall take fully into account the principle of special and differential treatment for developing and least-developed countries. Members recognize that this principle should extend beyond the granting of traditional transition periods for implementing commitments. In particular, the extent and the timing of entering into commitments shall be related to the implementation capacities of developing and least-developed Members. It is further agreed that those Members would not be obliged to undertake investments in infrastructure projects beyond their means.

3. Least-developed country Members will only be required to undertake commitments to the extent consistent with their individual development, financial and trade needs or their administrative and institutional capabilities.

4. As an integral part of the negotiations, Members shall seek to identify their trade facilitation needs and priorities, particularly those of developing and least-developed countries, and shall also address the concerns of developing and least-developed countries related to cost implications of proposed measures.

5. It is recognized that the provision of technical assistance and support for capacity building is vital for developing and least-developed countries to enable them to fully participate in and benefit from the negotiations. Members, in particular developed countries, therefore commit themselves to adequately ensure such support and assistance during the negotiations.[5]

6. Support and assistance should also be provided to help developing and least-developed countries implement the commitments resulting from the negotiations, in accordance with their nature and scope. In this context, it is recognized that negotiations could lead to certain commitments whose implementation would require support for infrastructure development on the part of some Members. In these limited cases, developed-country Members will make every effort to ensure support and assistance directly related to the nature and scope of the commitments in order to allow implementation. It is understood, however, that in cases where required support and assistance for such infrastructure is not forthcoming, and where a developing or least-developed Member continues to lack the necessary capacity, implementation will not be required. While every effort will be made to ensure the necessary support and assistance, it is

[4] It is understood that this is without prejudice to the possible format of the final result of the negotiations and would allow consideration of various forms of outcomes.

[5] In connection with this paragraph, Members note that paragraph 38 of the Doha Ministerial Declaration addresses relevant technical assistance and capacity building concerns of Members.

understood that the commitments by developed countries to provide such support are not open-ended.

7. Members agree to review the effectiveness of the support and assistance provided and its ability to support the implementation of the results of the negotiations.

8. In order to make technical assistance and capacity building more effective and operational and to ensure better coherence, Members shall invite relevant international organizations, including the IMF, OECD, UNCTAD, WCO and the World Bank to undertake a collaborative effort in this regard.

9. Due account shall be taken of the relevant work of the WCO and other relevant international organizations in this area.

10. Paragraphs 45–51 of the Doha Ministerial Declaration shall apply to these negotiations. At its first meeting after the July session of the General Council, the Trade Negotiations Committee shall establish a Negotiating Group on Trade Facilitation and appoint its Chair. The first meeting of the Negotiating Group shall agree on a work plan and schedule of meetings.

Author Biographies

Barry Desker is the Director of the Institute of Defence and Strategic Studies, Nanyang Technological University. He was Singapore's Ambassador to Indonesia from 1986 to 1993 and the Chief Executive Officer of the Singapore Trade Development Board from 1994 to 2000. He helped to organize the first WTO Ministerial Conference in Singapore in December 1996 and was Singapore's negotiator for the Information Technology Agreement (1996). Ambassador, Desker was educated at the University of Singapore, the University of London and Cornell University.

Minoru Endo graduated from the University of Tokyo, Law School in 1957. He then entered the Japanese Ministry of Foreign Affairs and since then served in the Ministry and in its Embassies in France, Spain, the United States and the Mission in Geneva. He participated in the Kennedy Round, Tokyo Round and Uruguay Round Trade Negotiations. In 1987–1990 he was the Director-General of the United Nations Affairs Bureau in the Ministry. In 1990–1993 he was Ambassador for International Economic Affairs, and in 1993–1996 the Ambassador and Permanent Representative of Japan to the International Organizations in Geneva. In 1995 Minoru Endo served as the Chairman of the WTO Council on Trade in Goods. In 1997 he retired from the Foreign Service. Since then (1997–2001) he served as a Councilor to the Sakura Bank (later Sumitomo-Mitsui Banking Corporation). In 2002 Minoru Endo was appointed as a Commissioner of the International Civil Service Commission of the United Nations.

Gerhard Erasmus was born in 1949 and grew up in Namibia. He studied law at the University of the Orange Free State, Bloemfontein and in Leiden, Heidelberg, the Fletcher School of Law and Diplomacy and at Harvard. He is at present Professor in International Trade Law at the University of Stellenbosch in South Africa and Senior Research Fellow at the Trade Law Centre for Southern Africa (TRALAC); of which he is a founding member. He has also published and lectured in Constitutional Law and Public International Law. He was involved in the drafting of the Namibian Independence Constitution in 1990 and the new South African Constitution of 1996. He has also worked in several other African countries on matters such as international boundaries, water law, constitutional litigation and the transition to new governments. He is the South African member on the International Trade Law Committee of the ILA.

Wang Guiquo is Professor (Chair) of Chinese and Comparative Law, School of Law, City University of Hong Kong and Chairman of the Hong Kong WTO Research Institute. He holds a JSD degree from Yale Law School and an LL.M. degree from Columbia Law School. Dr. Wang is a Member of the International Academy of Comparative Law and is also: Vice President of the Chinese Society of International Economic Law, and a Guest Professor of Law at Nankai University, Tianjin; Wuhan Unviersity, Wuhan and the People's University of China, Beijing, China. Professor Wang is Senior Advisor to the Shanghai WTO Research Institute, Expert and Arbitrator of the China International Economic and Trade Arbitration Commission, and Advisor to the Shenzhen Municipality on WTO matters. Professor Wang is also an Honorary Advisor to the Ombudsman of Hong Kong and the Country Advisor to Butterworths. Professor Wang has published widely in internationally recognized journals in both Chinese and English. He has visited and lectured in numerous well-known universities and research institutes in Australia, Britain, Canada, France, Germany, Japan, Korea, Switzerland, the United States and Taiwan. He is the author of numerous publications in the international trade field.

Michael Hart is Simon Reisman professor of trade policy in the Norman Paterson School of International Affairs at Carleton University where he teaches courses on the laws and

institutions of international trade as well as advanced seminars on emerging trade issues, comparative trade policy, and the historical development of Canadian trade policy. He is a Professor and a Distinguished Fellow of the Centre for Trade Policy and Law at Carleton University where he provides strategic analysis and advice to governments, international organizations, and businesses on emerging trade policy issues and leads training missions to enhance the skill levels of officials in developing and transitional economies. He has led missions and provided advice to governments in Eastern Europe, Latin America, and Southeast Asia. Over the summer months, he acts as one of the two co-directors of the Center's Certificate Program, a program designed to upgrade the skills and knowledge of trade officials from developing countries and transitional economies. He is a former official in Canada's Department of Foreign Affairs and International Trade, where he specialized in trade policy and trade negotiations. He was involved in the Canada-US Free Trade Negotiations, the North American Free Trade Negotiations and various GATT, textile, and commodity negotiations. He was founding director of the Centre for Trade Policy and Law and stepped down in September 1996 after a second term as director. He holds an MA from the University of Toronto and is the author, editor, or co-editor of more than a dozen books and numerous articles and chapters in books on international trade issues.

Felipe Jaramillo, economist, participated in the work of the GATT between 1974 and 1992 as Ambassador of Colombia to the GATT. He led the Working Parties for the Provisional Accession (1975) and the Final Accession (1979–80) of Colombia to the GATT. He was the head of the Colombian delegation to the Tokyo Round negotiations and also acted as Chairman of the Informal Group of Developing Countries (1979–1984). He was Chairman of the GATT Council of Representatives during 1984, and Chairman of the Contracting Parties of the GATT in 1985. He also led the Colombian delegation to the Uruguay Round, played an important role in the launching of the negotiations, and chaired the Group of Negotiations in Services in the Uruguay Round. After his return to Colombia in 1992, he acted as Director for Trade Negotiations in the Ministry of Foreign Trade, and was Vice-Minister of Foreign Trade in 1998. He is now retired from public service.

Hassan S. Kartadjoemena is former Ambassador of Indonesia to the GATT and was the Chief Negotiator for Indonesia in the Uruguay Round from 1987 to the end of the Round and the signing of the results in Marrakesh in 1994. During that period he was also Chairman of the International Textiles and Clothing Bureau ("ITCB") and served in the GATT Textiles Surveillance Body. He is currently heading a Jakarta-based non-profit think tank on WTO-issues, the Center for Economic and Business Negotiations and Disputes Settlement. He is Chairman of the Management Committee of the Rotterdam-based Foundation for dialogue on trade issues between the EU and developing countries, the EU-LDC Network. At present he also serves as Adviser to the Indonesian National Committee for the Negotiations in the new WTO Round and Technical Adviser to the Ministry of Finance for financial services.

Adel Khalil was born in Egypt on June 1, 1940. He is a specialist with experience in trade promotion, investment promotion, trade policies, and WTO/GATT affairs and Agreements. He graduated from Cairo University (Faculty of Commerce) in 1961. He then obtained a post-graduate diploma in Business Administration (Marketing) in 1967 from the same University, then a M.A. degree in Economics (African Studies) from Howard University in Washington D.C. in 1971, and a Ph.D. degree in Economics with Honors

in 1981 from Cairo University. Dr. Khalil worked for the National Bank of Egypt from 1961–1963. From 1963 until 2000. Dr. Khalil worked in the Government's Trade Representation Department of the Ministry of Economy and Foreign Trade in Cairo, Egypt, and in its offices in Egyptian Embassies abroad, as Commercial Attaché, Counselor, and Minister. He became head (First Undersecretary) of that Department from 1995–1996. Embassies he worked in as commercial Representative were in: Washington, D.C. (1969–1972), Copenhagen (1975–1979), Bonn/Germany (1981–1982), London (1982–1985), Kuwait (1991–1995), and Geneva (1996—2000). After his retirement in September 2000, Dr. Khalil conducted several assignments for the Arab Economic Unity council, the Export Promotion Center of the Ministry of Economy and Foreign Trade in Egypt, the Arab Planning Institute (API) in Kuwait. At present, Dr. Khalil is a full time consultant for the Islamic Development Bank (IDB) in Jeddah, Saudi Arabia for WTO issues. Dr. Khalil has numerous research papers and articles published in Egyptian economic magazines.

Chulsu Kim is President of Sejong University in Seoul. As Deputy Minister of Trade from 1984 to 1990, Dr. Kim was Korea's chief trade negotiator. He chaired the Uruguay Round Negotiating Group on MTN Agreements in his personal capacity from 1987 to 1990. After serving as Korea's Minister of Trade, Industry and Energy from 1992 to 1993, he became the Deputy Director-General of the WTO in 1995 and served in that capacity until 1999. He is a graduate of Tufts University (B.A.) and the University of Massachusetts (M.A. and Ph.D.).

Antonio Ortiz Mena L.N. is Professor of International Relations and Chair of the International Studies Division at CIDE, specializing in international political economy. He received his M.A. in Area Studies (majoring in the Economics of Latin American Development) from the University of London (University College London), and his Ph.D. in Political Science (majoring in International Relations), from the University of California, San Diego (UCSD). He worked six years for the Mexican Government, and was Director of Congressional Relations of the Mexican Ministry of Trade and Industrial Development's NAFTA Negotiation Office from 1991 to 1993.

Julio J. Nogués is Professor of International Trade Institutions and Trade Policies at Di Tella University in Buenos Aires. He is also currently serving as a consultant to several international organizations. Before that he was Deputy Manager at the Central Bank, Senior Economist at the Office of the Chief Economist of the World Bank, Trade Representative of Argentina in the United States, Executive Director at the Board of the World Bank, Undersecretary for Economic Policy, and Undersecretary for Trade Policy at the Ministry of Economy of Argentina. He has published more than seventy chapters and articles.

Sylvia Ostry, Ph.D., is the Distinguished Research Fellow, Centre for International Studies, University of Toronto. She has a doctorate in economics from McGill University and Cambridge University. Dr. Ostry has held a number of positions in the Canadian Federal Government, among them, Chief Statistician, Deputy Minister of Consumer and Corporate Affairs, Chairman of the Economic Council of Canada, Deputy Minister of International Trade, Ambassador for Multilateral Trade Negotiations, and the Prime Minister's Personal Representative for the Economic Summit. From 1979 to 1983 she was Head of the Economics and Statistics Department of the OECD in Paris. Dr. Ostry has written numerous books and articles. She has received 18 honorary degrees from universities in Canada and abroad and, in 1987, received the Outstanding Achievement Award of the Government of Canada. In December, 1990 she was made a Companion

of the Order of Canada, the highest award in the Canadian national system of honors. In June, 1991 she was admitted as a Fellow of the Royal Society of Canada. She is a member of Advisory Group to the Director General, World Trade Organization; member of the Inter-American Dialogue; member of the Advisory Board, Institute of International Economics, Washington. Dr. Ostry is a member of the Group of Thirty, Washington, member of the Academic Advisory Council of the Deputy Minister for International Trade, and a founding member of the Pacific Council on International Policy. In 1992 the Sylvia Ostry Foundation annual lecture series was launched by Madam Sadako Ogata, U.N. High Commissioner for Refugees; 1993 Jacques Delors President of the European Union; 1994 Michel Camdessus, Managing Director, International Monetary Fund; 1996 Renato Ruggiero, Secretary General, World Trade Organization, 1999 Enrique Iglesias, President, Inter-American Development Bank, 2002 Paul Volcker, Chairman of the Board of Governors of the Federal Reserve System from 1979–1987.

Hugo Paemen is currently Adjunct Professor at the BMW Center for German and European Studies of the Edmund A. Walsh School of Foreign Service (Georgetown University). He also serves as Senior Advisor to Hogan & Hartson, L.L.P., and to the German Marshall Fund, and is Co-Chairman of the European-American Business Council (EABC). Previously Ambassador Paemen served as Head of the European Delegation to the United States. His career in foreign service began with several posts in the Belgium diplomatic corps, both overseas and in Brussels. He later served at the European Commission as Chief of Staff for Vice-President Viscount Davignon, as the Spokesman for External Relations, leading the European negotiating team during the multilateral trade negotiations of the Uruguay Round. He also lectured on European Policy and Integration Problems at the College of Europe (Natolin, Poland) and at the Catholic University of Leuven (Belgium), where he continues to be a Member of the Board. He has written and contributed to books and articles relating to current diplomatic and trade issues.

Amelia Porges practices law at Sidley Austin Brown & Wood LLP in Washington, DC, where she advises businesses, trade associations and governments on the use of trade and investment rules to solve market access problems and resolve disputes. Ms. Porges has argued cases in the GATT and WTO, drafted trade agreements, negotiated and advised on U.S. trade legislation, and advised in many bilateral and multilateral trade negotiations. Before entering private practice, she served as Senior Counsel for Dispute Settlement and head of enforcement at USTR, and Senior Legal Officer and Counsellor for Legal Affairs at the GATT Secretariat during the Uruguay Round. She has published extensively on GATT and WTO law.

Daniel M. Price chairs Sidley Austin Brown & Wood LLP's International Trade and Dispute Resolution practice. He counsels multinational companies, financial institutions and trade associations on market access, services, investment and sanctions issues, and matters arising in intergovernmental negotiations. Mr. Price also advises companies and governments in disputes arising under the WTO Agreements, other trade agreements, and investment treaties; he has represented parties in disputes under NAFTA and before the WTO and the International Centre for Settlement of Investment Disputes (ICSID). He has also provided technical assistance to the governments of Bulgaria, China, Colombia and Vietnam on international trade and investment rules. Before joining the Firm, Mr. Price served as USTR Principal Deputy General Counsel, where he negotiated trade and investment agreements with the former Soviet Union, Eastern Europe and Latin

America. He also served as USTR's lead negotiator on investment issues in the NAFTA talks and as legal adviser on the GATT Uruguay Round investment agreement. He is a member of the Department of State's Advisory Committee on International Economic Policy, the Council on Foreign Relations, the Advisory Board of Georgetown University Law Center's Institute of International Economic Law, and the Advisory Board of the Canada-United States Law Institute.

Julia Selivanova, an attorney working in the WTO Practice Group of Baker & McKenzie, is based in Geneva. She has dealt extensively with matters related to the accession of Russia to the WTO and worked as a consultant on WTO accession issues for the United Nations Institute for Training and Research. Ms. Selivanova received her undergraduate degree in law from MGIMO (Moscow State University of International Relations with Ministry of Foreign Affairs of Russia) specializing in international trade law. She received her Masters in International Law and Economics from the World Trade Institute in Bern, Switzerland where her studies focused on international economic law and the World Trade Organization legal system. Currently Ms. Selivanova is researching her doctorate at the World Trade Institute.

Damdin Tsogtbaatar is Foreign Policy Advisor to the President of Mongolia (since February 2002). He also served as the Deputy Director, Multilateral Cooperation Department, Ministry of Foreign Affairs, Mongolia and as a WTO desk-officer, Department of Foreign Trade and Economic Cooperation, Ministry of External Relations, Mongolia. He has a Master of Legal Studies, International Law, School of Law, ANU, Canberra, Australia (1998), and an M.A. Political Science (Hon), Institute of International Relations, Moscow, Russia (1994).

David Walker is Principal Economic Adviser at the New Zealand Ministry of Foreign Affairs and Trade, and APEC Senior Official for New Zealand. In this latter capacity he is responsible for the development of New Zealand's policy objectives for APEC and for representing New Zealand at APEC Senior Officials Meetings. Prior to his current position, Dr. Walker was Deputy Chief of Mission at the New Zealand Embassy to the United States in Washington DC. Dr. Walker was also Director of the Ministry's APEC Division and New Zealand APEC Senior Official during the period New Zealand chaired the APEC process in 1999.

Before that Dr. Walker spent a period on secondment with Telecom New Zealand as Strategic Issues Manager in Telecom's corporate strategy group. He has also served as head of the Ministry's Trade and Economic Analysis Division and has had previous postings in London and Geneva, where he was involved with the Uruguay Round of multilateral trade negotiations. Areas of Uruguay Round responsibility included services, intellectual property, investment, rules, dispute settlement and institutional issues. While in Geneva Dr. Walker served as Chair of the GATT Anti-Dumping Committee and he has also served on two GATT/WTO dispute settlement panels. Prior to joining the Ministry, Dr. Walker taught economics at Canterbury University where he gained a Ph.D. in regulatory economics.

Wang Yaotian is the Chairman of the WTO Shanghai Research Centre, Professor of Shanghai Institute of Foreign Trade, and Policy Advisor of the Ministry of Foreign Trade and Economic Cooperation of the People's Republic of China. He was born in Anhui Province, China in 1918. He earned a Bachelor of Arts diploma in economics from Fudan University in 1944. In 1948, Professor Wang earned a Master of Business Administration degree at Washington University in St. Louis, then began to pursue his

Ph.D. in economics at Columbia University in New York. From 1950, he served as the Deputy Director of Foreign Trade Administration Section of the Ministry of Foreign Trade of the People's Republic of China. He is a key drafter of the Import and Export Administration Regulations of the PRC promulgated by China's central government in the 1950s. After his departure from the Ministry of Foreign Trade, he served as a professor in: Beijing Institute of Foreign Trade, Fudan University, Shanghai International Studies University and Shanghai Institute of Foreign Trade. Professor Wang introduced David Ricardo's Comparative Advantage Theory, the General Agreement on Tariffs and Trade and the World Trade Organization systematically to reforming China, thus giving a theoretical root to China's "open-door" policy. In 1992, Professor Wang was selected as one of China's most distinguished professors by the State Council of the PRC. He has published more that thirty books on trade and economics. Professor Wang is the Editor-in-Chief of the Chinese translation of the final legal documents of the Uruguay Round published in 1994, and the Chairman of the Editorial Committee of China's first WTO-related academic journal WTO Focus.
